Presented at the

26th IAEA Fusion Energy Conference  
Kyoto, Japan

October 21<sup>st</sup> 2016

# ELM Pacing Obtained with D<sub>2</sub> and Li Pellet Injection in Low-Torque ITER-Baseline Scenario (IBS)

- **D<sub>2</sub> pellet injection up to 9X natural f<sub>ELM</sub> in IBS at applied torque T<sub>inj</sub> ~0 Nm**

- ELM pacing and mitigation observed

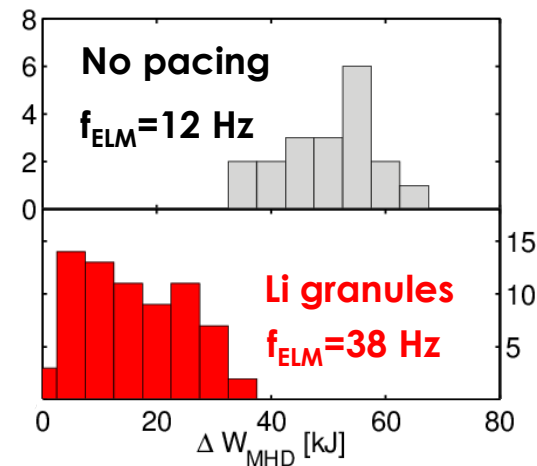

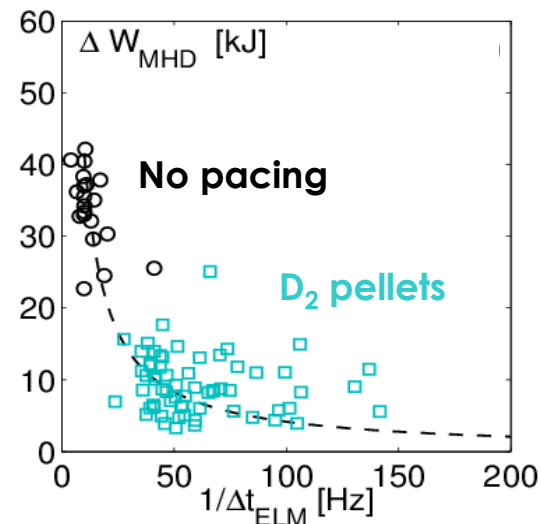

*ITER operation at 15MA may need up to 30X reduction of ELM heat flux*

- **ELM pacing obtained with non-fuel granule injection (lithium)**

- Effective mitigation at high q<sub>95</sub>, low n<sub>e</sub>

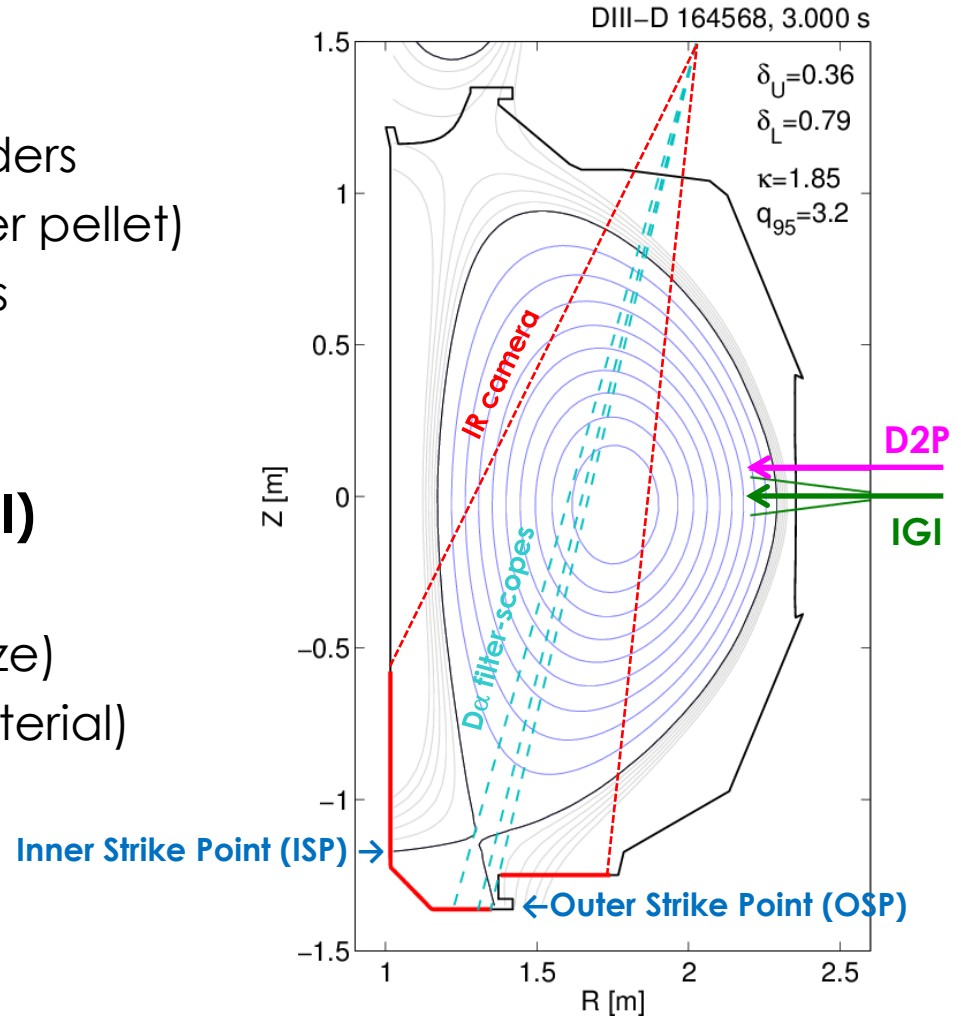

- Mitigation not achieved in IBS

*In ITER, D<sub>2</sub> pellets for ELM control might use up to 40% of total allowed fuel throughput*

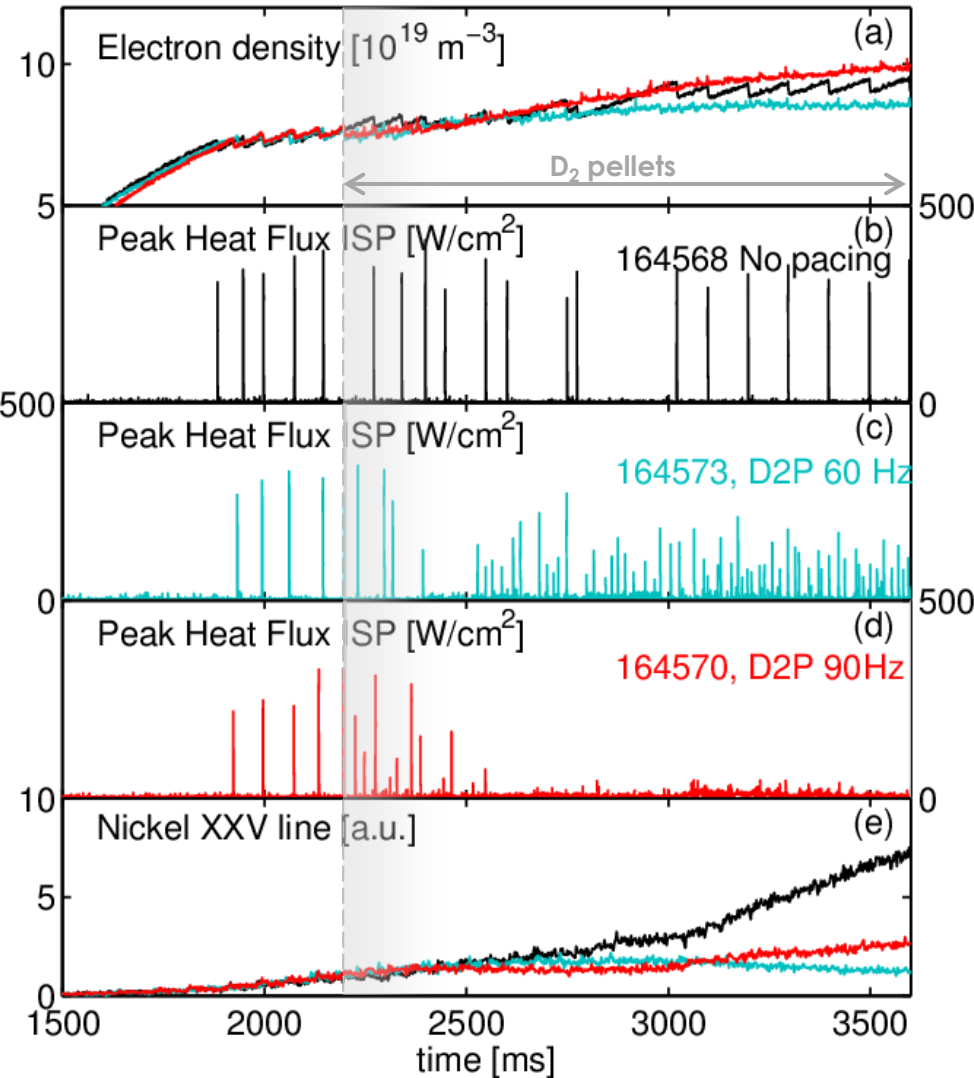

# Upgrades of Injection Systems Enable Faster Injection Rates with D<sub>2</sub> and Non-fuel Pellets

- **D<sub>2</sub> pellet injector (D2P)**
  - 3 guns, 90Hz with new extruders
  - 1.3x0.9 mm (7x10<sup>19</sup> atoms per pellet)
  - Injection speed~100-150 m/s
- **Impurity Granule Injector (IGI)**
  - Li, C, B<sub>4</sub>C, 0.3-1.0 mm
  - Up to 300 Hz (depends on size)
  - 50-150 m/s (depends on material)

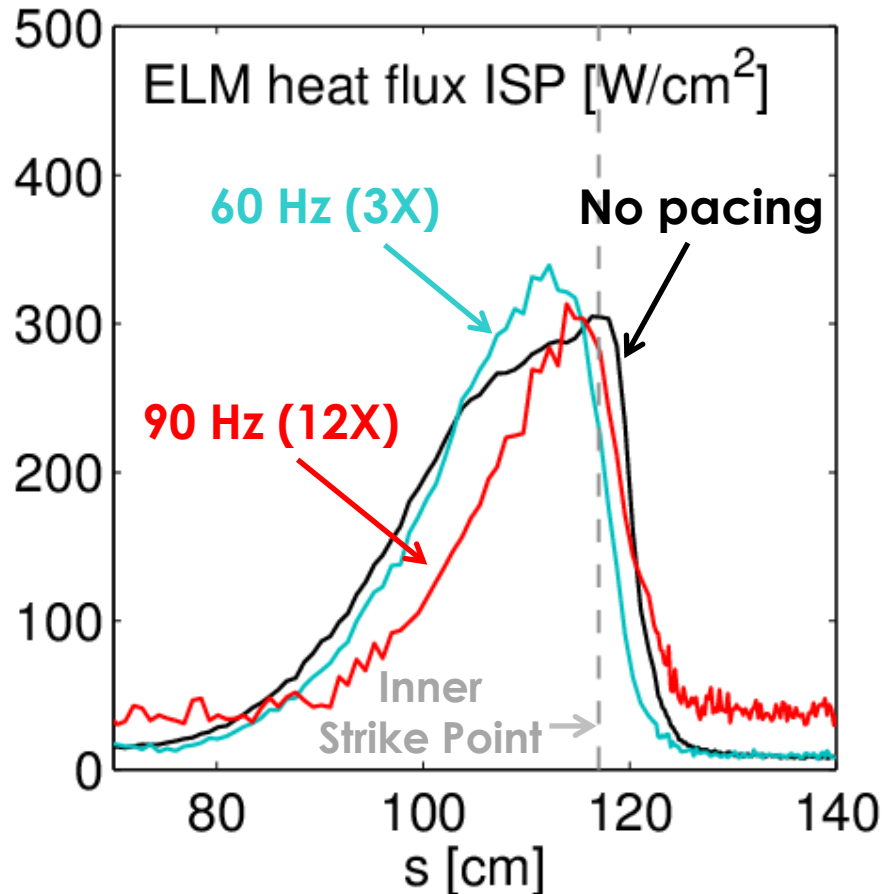

# Heat Flux Mitigation Obtained with D<sub>2</sub> Pellets in ITER Baseline Scenario (IBS) at Zero Torque

- $\beta_N=1.7$ ,  $q_{95}=3.2$ ,  $T_{inj}\sim 0.0$  Nm
- **Reference no D2P**,  $f_{ELM}\sim 10$  Hz
  - $q_{peak}\sim 350$  W/cm<sup>2</sup>
- **D2P 60 Hz**  $\rightarrow f_{ELM}\sim 60$  Hz
  - $q_{peak}\sim 50-100$  W/cm<sup>2</sup>
- **D2P 90 Hz**  $\rightarrow f_{ELM}\sim 90$  Hz
  - $q_{peak} < 30$  W/cm<sup>2</sup>
- **No Ni accumulation with D2P**

# Moderate Reduction of ELM Footprint Observed During ELM Mitigation by D<sub>2</sub> Pellet Injection

- **D2P 60 Hz**  
ELM heat flux footprint width similar to natural ELMs
- **D2P 90 Hz**  
Footprint ~20% narrower

# Approximate $1/f_{\text{ELM}}$ Scaling of $q_{\text{peak}}$ and $\Delta W_{\text{MHD}}$ Observed

- 60 Hz injection  $\rightarrow q_{\text{peak}}, \Delta W_{\text{MHD}} \sim 1/f_{\text{ELM}}$  ( $f_{\text{ELM}} = 1/\Delta t_{\text{ELM}}$ )
- 90 Hz injection  $\rightarrow q_{\text{peak}}$  strongly reduced at all frequencies

# High Frequency D<sub>2</sub> Injection Reduces Pedestal Pressure

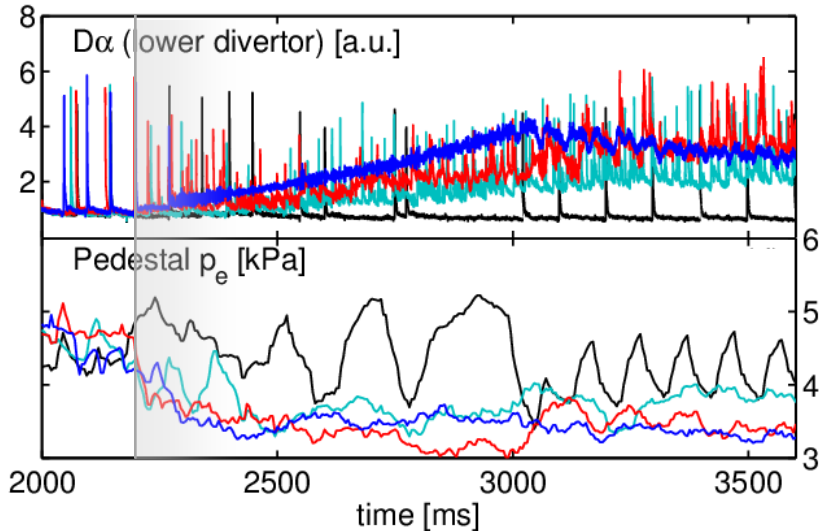

164573, D2P 60 Hz 164570, D2P 90Hz  
164568 No pacing

- **Increase of Dα baseline by D2P**
  - Additional fueling from neutrals
- **p<sub>e,ped</sub> reduced by edge cooling**
  - At 90 Hz, p<sub>e,ped</sub> ~20-30% lower

# High Frequency D<sub>2</sub> Injection Reduces Pedestal Pressure

164573, D2P 60 Hz    164570, D2P 90Hz  
164568 No pacing    164574, Gas Inj.

- **Increase of D $\alpha$  baseline by D2P**
  - Additional fueling from neutrals
- **p<sub>e,ped</sub> reduced by edge cooling**
  - At 90 Hz, p<sub>e,ped</sub> ~20-30% lower
- **Similar pedestal parameters with 90Hz D2P and equivalent D<sub>2</sub> gas**
  - Discharge free from type-I ELMs

# ELM Pacing Obtained with D<sub>2</sub> and Li Pellets, in Low-torque ITER-Baseline Scenario (IBS)

- **D<sub>2</sub> pellet injection up to 9X natural f<sub>ELM</sub> in IBS at applied torque T<sub>inj</sub> ~0 Nm**
  - ELM pacing and mitigation observed

*ITER operation at 15MA may need up to 30X reduction of ELM heat flux*

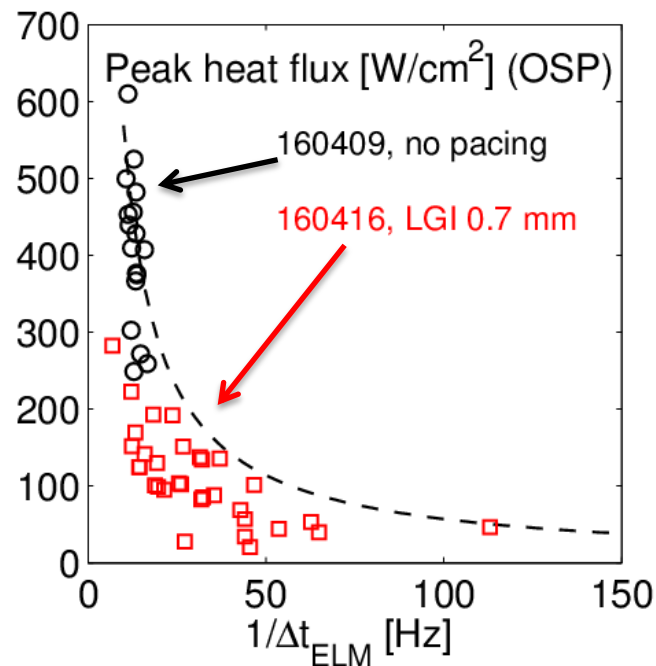

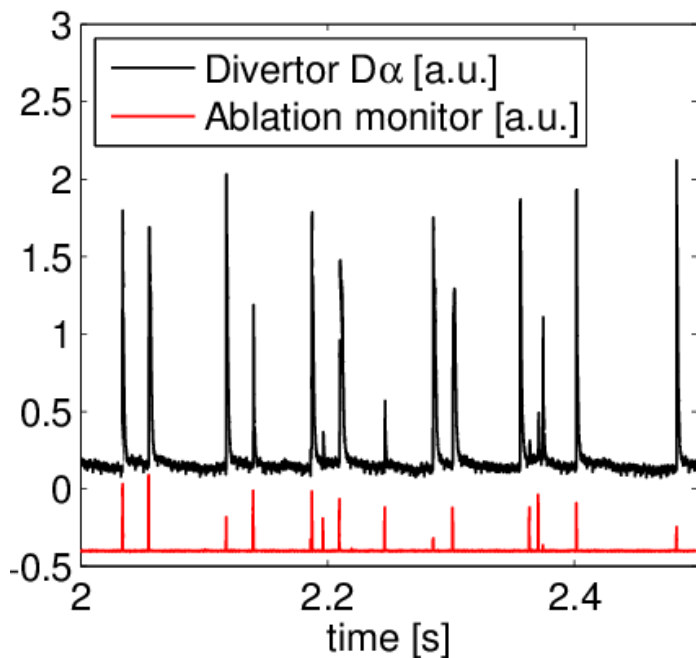

- **ELM pacing obtained with non-fuel granule injection (lithium)**
  - Effective mitigation at high q<sub>95</sub>, low n<sub>e</sub>
  - Mitigation not achieved in IBS

*In ITER, D<sub>2</sub> pellets for ELM control might use up to 40% of total allowed fuel throughput*

# ELM Pacing and Mitigation Demonstrated with Li Granules

$\beta_N=1.4$ ,  $q_{95}=4.6$ ,  $T_{inj}=3$  Nm,  $P_{inj}=4$  MW,  $f_{ELM}\sim 12$  Hz (**Not IBS!**)

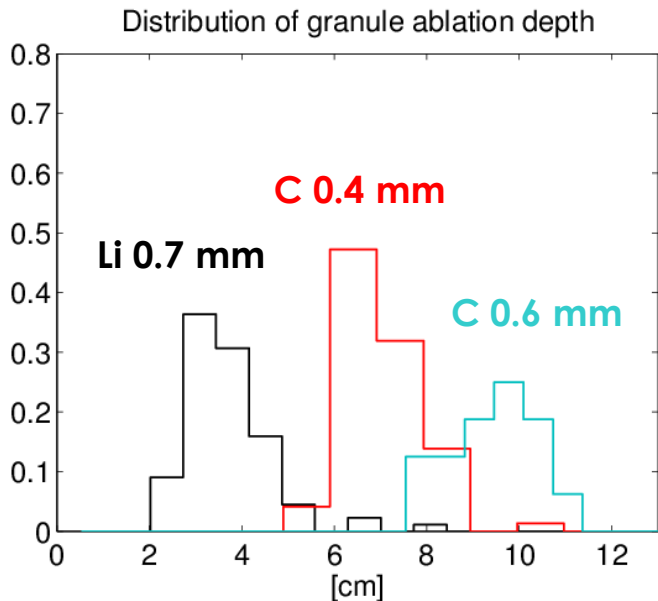

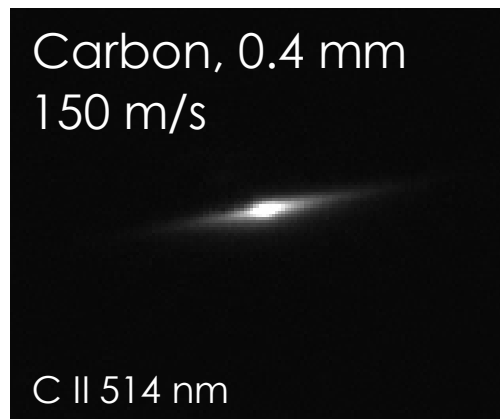

- **ELM triggering efficiency increases with granule size**
  - Pacing  $f_{ELM}\sim 38$  Hz (3X)
  - Transiently  $f_{ELM}\sim 100$  Hz (8X)

- **At OSP  $q_{peak} < 1/f_{ELM}$** 
  - At ISP,  $q_{peak} \geq 1/f_{ELM}$

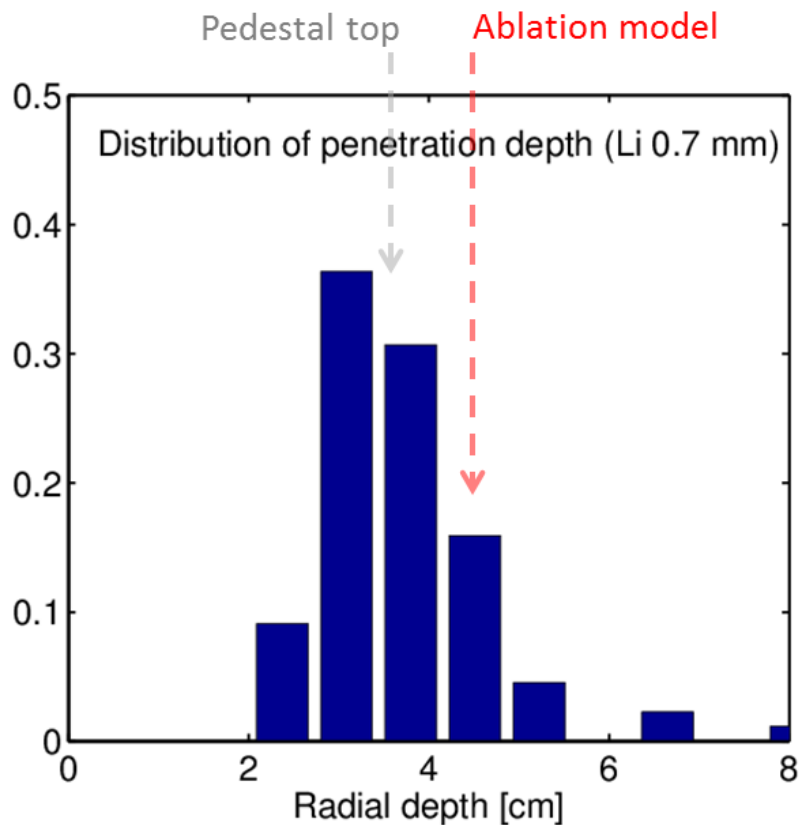

Bortolon, NF 2015

# Penetration Depth of Different Materials Tested in IBS

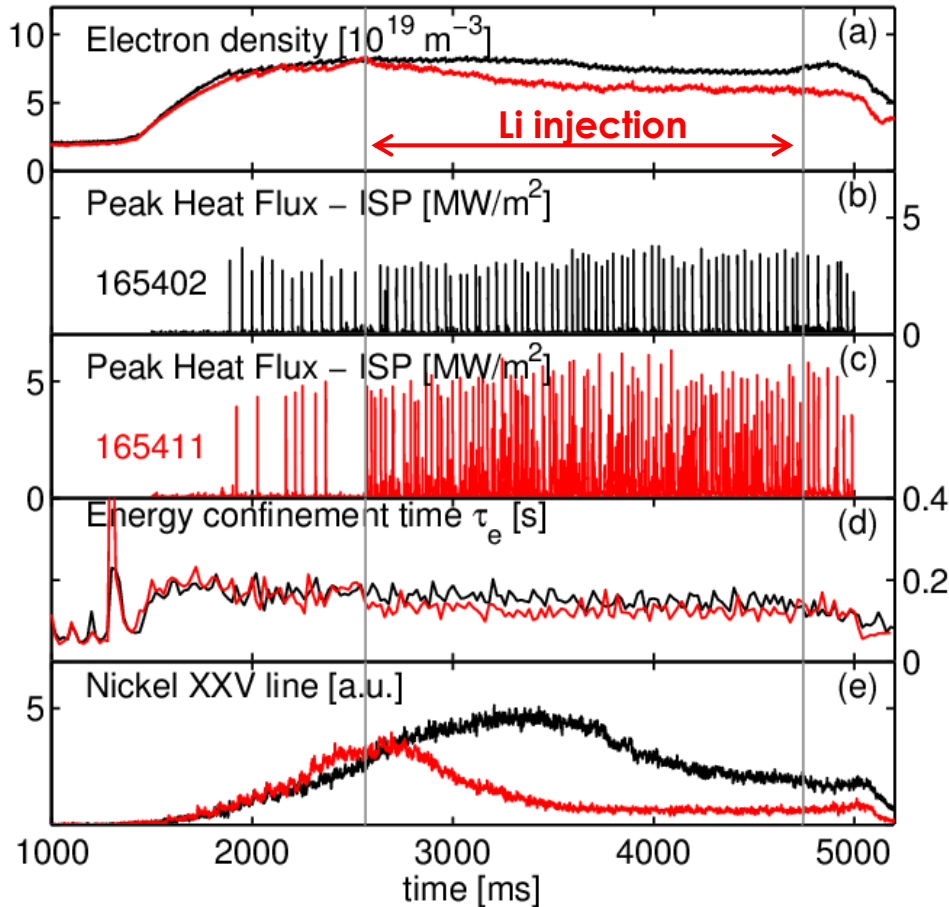

- $B_4C$  tends to shatter at LCFS due to thermal stresses on sharp edges
- **C deepest penetration (5-12 cm)**
  - From measured ablation times and injection velocity, assumed constant

# Li 0.7mm Granules Optimize Deposition at Pedestal Top

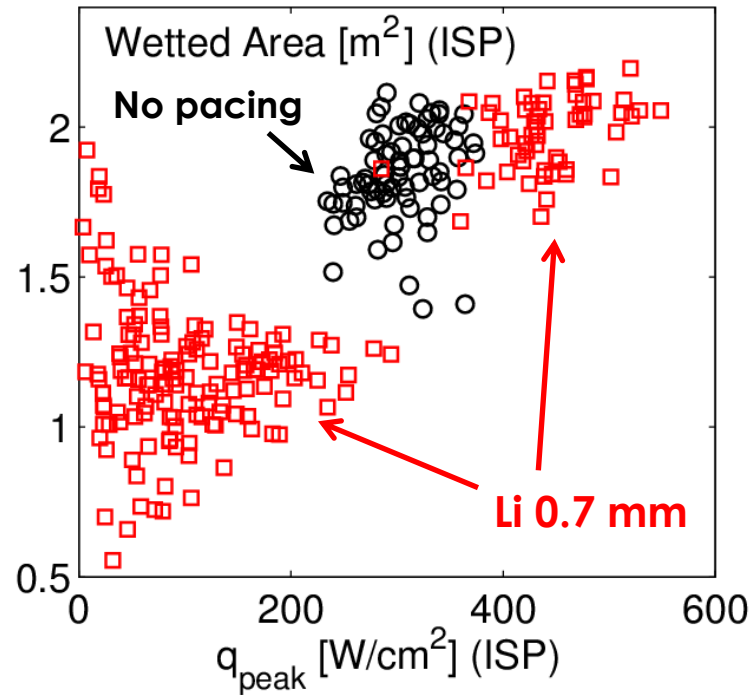

- **Most of 0.7mm Li granules reach 3-4 cm inside the LCFS**
- **New ablation model for Li predicts moderately deeper penetration than observed**  
*Parks, to be submitted*
- **Pedestal top is 3 cm inside the LCFS**
  - MHD simulations find ELM triggered when pressure peaks at pedestal top  
*Futatani, NF 2014*

# In IBS, Li Granules Effective in Pacing, but not Mitigation

- **IBS  $\beta_N=1.7$ ,  $T_{inj}=2.0$  Nm,  $f_{ELM} \sim 25$  Hz**
- **Li 0.7 mm, 100 m/s, 130 Hz**
  - $f_{ELM} \sim 130$  Hz ( $\sim 5X$ )
  - Triggering efficiency  $>85\%$
- **Strong density pump-out**
  - $n_e$  lower by 15% ( $v_{ped}^* \sim 3.5 \rightarrow 1.3$ )
  - $\tau_E$  lower by 10-20%
- **Reduction of metals (Ni) in core**
- **During Li, large ELM remain**
  - $f_{LE} \sim 41$  Hz (1.6X)
  - $q_{peak,LE} \sim q_{peak}$  before and after Li

# Two Classes of Li-Triggered ELMs Observed: Large & Small

- **For large ELMs,  $q_{\text{peak}}$  and wetted area similar to natural ELMs**
  - Weakly dependent on  $\Delta t_{\text{ELM}}$
- **Li injection changes pedestal structure**
  - Lower  $n_{e,\text{ped}}$ , higher  $T_{e,\text{ped}}$  (dilution),  $v_{\text{ped}}^* \sim 3.5 \rightarrow 1.3$

# Changes of Pedestal Affect Effectiveness of Mitigation

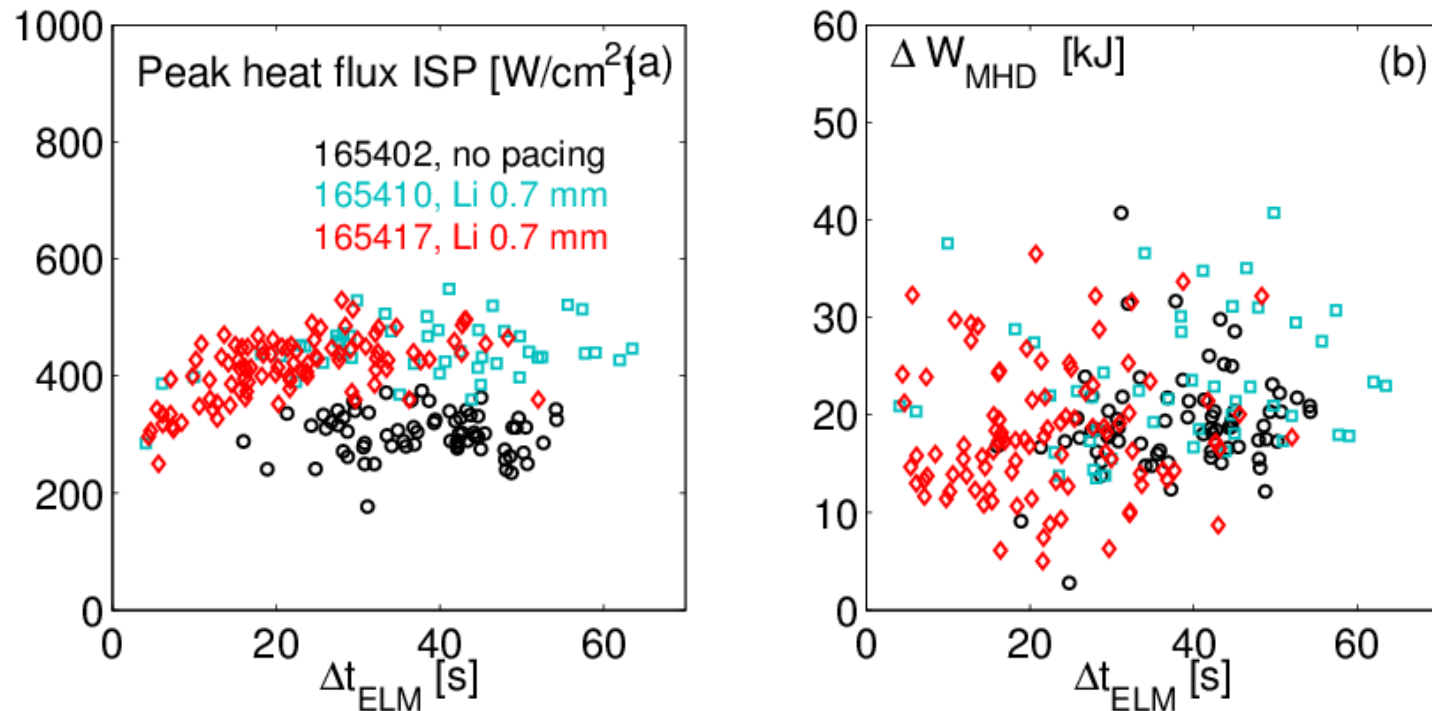

- **ELM pacing and mitigation with D2P obtained in zero-torque IBS**
  - Up to 6X increase of frequency with mitigation  $\sim 1/f_{\text{ELM}}$
  - At higher  $f_{\text{inj}}$ , mitigation correlates with lower  $p_{\text{e,ped}}$  associated with secondary fueling effects
- **ELM pacing and mitigation obtained with non-fuel pellets (Li)**
  - Ablation dynamics of C and  $\text{B}_4\text{C}$  confirm importance of tailoring deposition profile
- **In IBS, peak heat flux mitigation with Li is challenging**
  - Possibly associated with reduced  $v_{\text{ped}}^*$
- **M3D-C<sup>1</sup> simulations in progress to study conditions for ELM triggering**
  - Accurate extrapolation to ITER requires predicting changes to pedestal profiles under repetitive pellet injection

*Fil, TH/P1-10*

# Back up slides

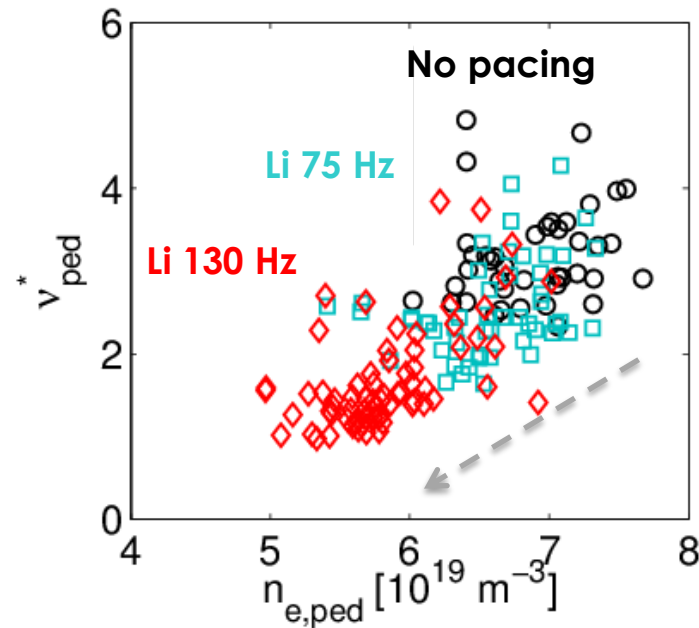

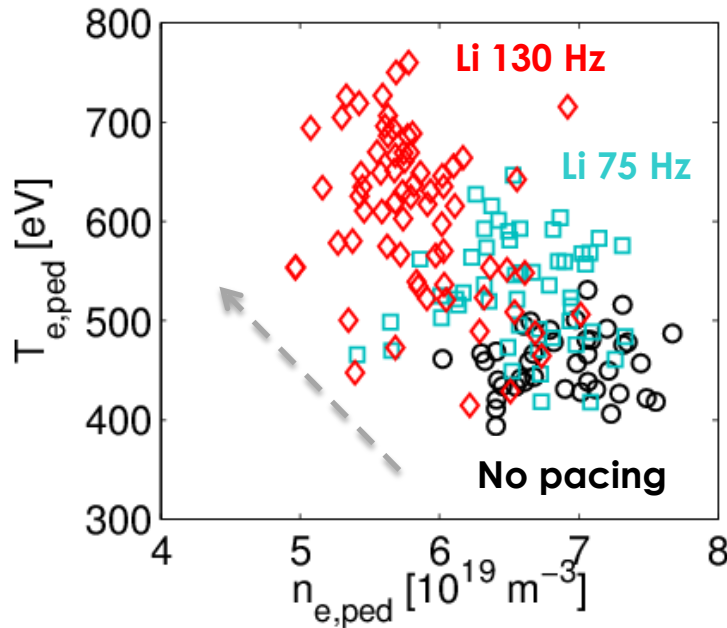

# For large ELMs, size depends weakly on pre-ELM period

- **Small ELMs don't affect significantly pedestal evolution**
  - Consider only large ELMs ( $q_{\text{peak}} > 300 \text{ W/cm}^2$ )
- **Small changes in ELM observables, across  $\Delta t_{\text{ELM}} = 5\text{-}50 \text{ ms}$**

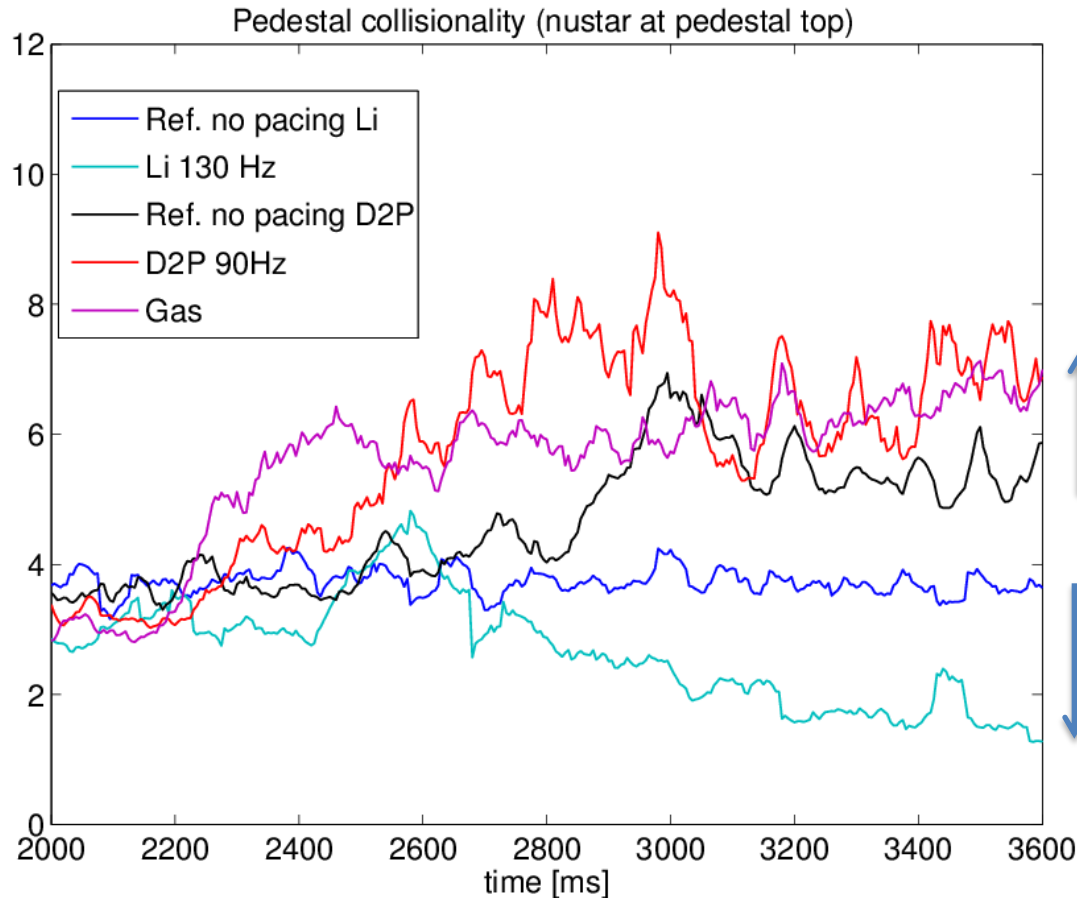

# Pedestal changes observed during Li injection can lead to larger ELMs

- **Li injection changes pedestal structure**
  - Lower  $n_{e,ped}$ , higher  $T_{e,ped}$  (dilution)
  - Collisionality  $\nu^*_{ped} \sim 3.5 \rightarrow 1.3$
- **Multi-machine scaling indicates larger ELM size at lower  $\nu^*_{ped}$**

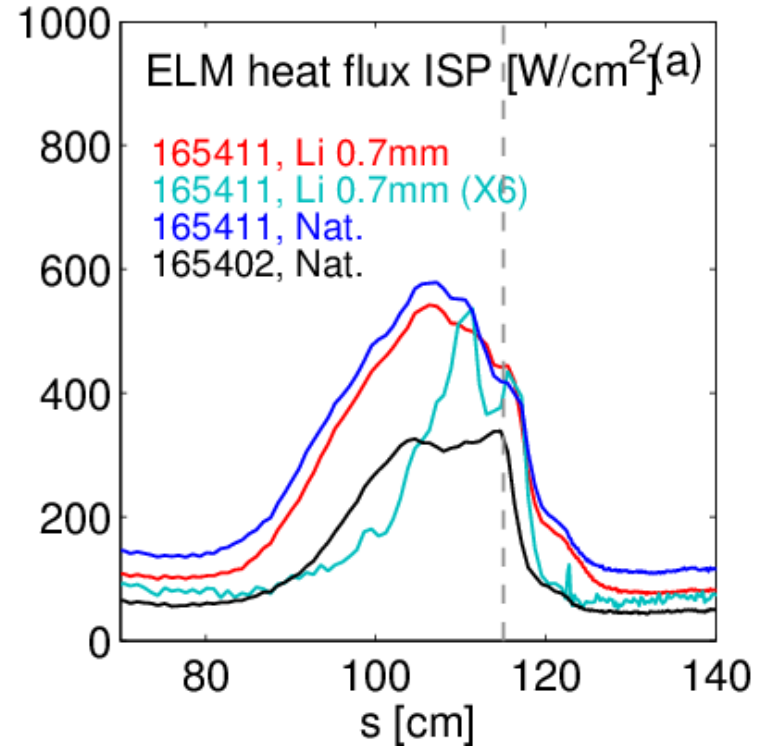

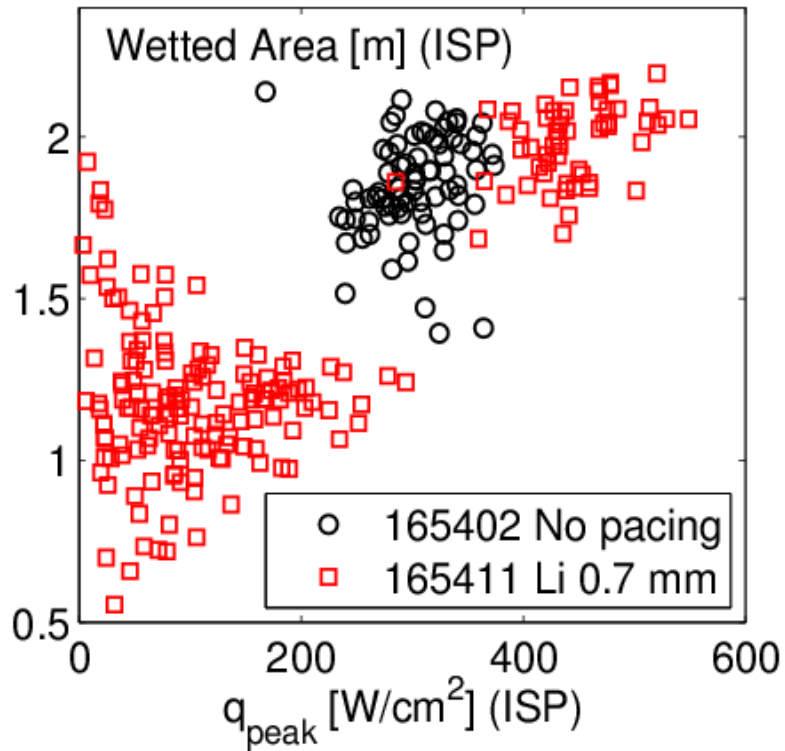

# High frequency injection of D<sub>2</sub> and Li pellets modifies collisionality in opposite ways

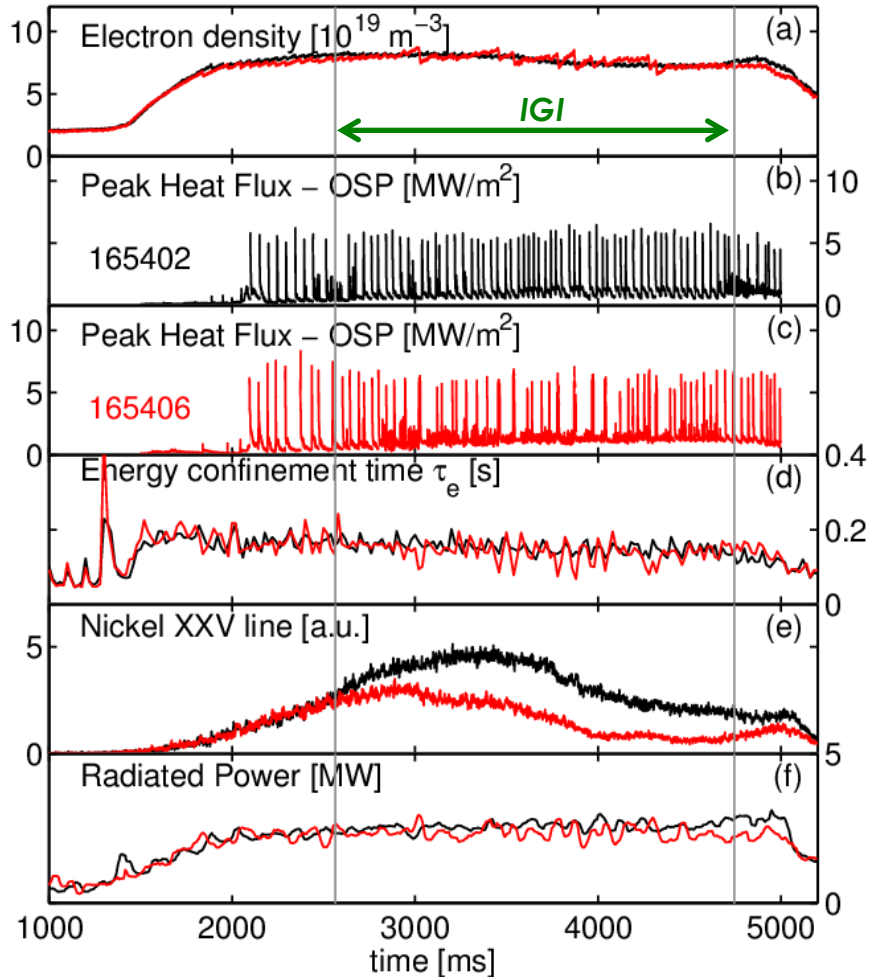

$\nu^*$  increases with  
90 Hz D2P (or gas)

$\nu^*$  decreases with  
130 Hz LGI

# Li-triggered ELMs show broad distribution of $q_{\text{peak}}$

# ELM pacing with C spheres achieved, not mitigation

- **ITER baseline scenario,  $q_{95}=3.2$** 
  - $\beta_N=1.7$  (feedback controlled)
  - $P_{inj}=4-5$  MW,  $T_{inj}=0.6-1.5$  N m
  - $f_{ELM} \sim 25$  Hz
- **C sphere injection 2.6-4.8 s**
  - 0.4 mm, 130 m/s, 60 Hz
- **C injection results in a combination of large and small ELMs**
  - Overall triggering efficiency  $\sim 50\%$  (including events with  $q_{peak} > 30$  W/cm<sup>2</sup>)
- **For larger ELMs,  $f_{ELM} \sim 10$  Hz**
  - $q_{peak}$  similar to ref. shot
  - $q_{peak} \sim q_{peak}$  after IGI phase
- **Reduction of core Ni**
- **Similar confinement time  $\tau_e$  and  $P_{rad}$**

# Table of relevant impurity parameters

	<u>Li</u>	Li	D2	Be	<u>B4C</u>	<u>C glass</u>	<u>B</u>
Sublimation energy (eV)	1.6	1.6	0	3.3	5.3	7.5	5.8
Density [g/cm <sup>3</sup> ]	0.53	0.53	0.2	1.85	2.52	1.5	2.37
Radius [mm]	0.7	0.9	1.49	1	0.5	0.5	0.5
Electrons per granule	<u>2.49E+19</u>	5.30E+19	1.04E+20	2.59E+20	<u>4.67E+19</u>	<u>2.96E+19</u>	<u>4.22E+19</u>
	<u>27.222</u>	57.857	13.226	416.893	<u>107.533</u>	<u>81.770</u>	<u>91.418</u>

- **Carbon, B4C, Boron, have higher sublimation energy than Li/D2**
  - Deeper penetration
  - Larger impact on energy balance (might induce H-L back transitions)
