

Special Issue on Organic Synthesis

Call for Papers

Organic synthesis is a special branch of chemical synthesis and is concerned with the construction of organic compounds via organic reactions. Organic molecules can often contain a higher level of complexity compared to purely inorganic compounds, so the synthesis of organic compounds has developed into one of the most important branches of organic chemistry. There are two main areas of research fields within the general area of organic synthesis: total synthesis and methodology. The goal of this special issue is to provide a platform for scientists and academicians all over the world to promote, share, and discuss various new issues and developments in the area of **organic synthesis**.

In this special issue, we are going to invite front-line researchers and authors to submit original research and review articles that explore **organic synthesis**. Potential topics include, but are not limited to:

- Total synthesis
- Stereoselective synthesis
- Synthesis design
- Synthesis of protein
- Synthetic fiber and synthetic plastics
- Synthetic pesticides
- Synthetic method and synthetic route

Authors should read over the journal's [Authors' Guidelines](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal at [Paper Submission System](#).

Please kindly notice that the "**Special Issue**" under your manuscript title is supposed to be specified and the research field "**Special Issue — Organic Synthesis**" should be chosen during your submission.

According to the following timetable:

Submission Deadline	September 3rd, 2013
Publication Date	November 2013
