

Interactive comment on “Technical Note: Low Cost Mesocosms Design for Studies of Tropical Marine Environments” by Ruben R. Raygosa-Barahona et al.

Anonymous Referee #1

Received and published: 2 April 2019

The current manuscript is a kind of technical report, not scientific article. The manuscript introduces the use of electric thruster system to avoid water stratification. Some results about the test compared to the in situ data suggest the temperature variability could be considered within the natural daily changes. However, there is any chemical and biological data in the mesocosm tank in this study. Of course, seawater temperature is a very important environmental factor, as the author said. But I would like to suggest additional data regarding the marine biogeochemistry such as Chl. *a* and phytoplankton species composition and biomass, and pH, POC and DOC etc.
