National Security – Reduce Risk By Instantly Determining Entity Friend From Foe

Your government has a rapidly growing national security problem. An AI system in one jurisdiction can create increasingly smart, malicious, digital bots at speeds of thousands or more per second. In the next second, they're operating in all other jurisdictions on the planet, including yours, targeting your citizens, companies, enterprises, and different levels of government. Today on the planet, there's no ability to instantly determine entity friend from foe. Thus, it results in increasing economic, criminal, and political chaos.

Over the past 8 years, I've slowly created a new legal identity architecture addressing this. **It can instantly determine entity friend from foe.** How?

A new age CRVS (Civil Registration Vital Statistics) system can register legal identities of digital bots at transactional speeds. Each entity has a unique legal identity which can be instantly queried by third parties to determine:

- If they're a bot or a human
- Their legal identity
- Any types of legal identity relationships they might have with humans, AI systems, and bots
- Any credentials they might have been granted by a credential issuing body
- Any types of legal authorization rights they might have

It also gives your citizens digital signatures able to be used to sign pictures/videos of themselves

To see how this could work in real life, skim these two articles:

- [“An Identity Day in the Life of Jane Doe”](#) to see how citizen Jane can almost instantly determine a deep fake attack against her
- [“Hives, AI, Bots & Humans - Another Whopper Sized Problem”](#) to see how the architecture allows for rapid creation of hive relationships

Note: It's now possible in some jurisdictions on the planet for an AI system to own a company. It's already happened in one jurisdiction. Skim [“Legal Identity Vs. Legal Personhood”](#). The architecture allows for AI systems to have legal identities, which can then be registered in your jurisdictions LLC administrative systems and the actual LLC.

Your country is entering a major paradigm shift where your government's old ways won't work well anymore. Thus, it requires out of the box thinking, for your out of the box times. Your companies, enterprises, citizens, and different levels of government can leverage the architecture to instantly determine entity friend from foe. It significantly addresses and reduces a rapidly growing national security risk. [It also gives your industry significant competitive advantages.](#)
