# TALYS for charged-particle cross sections: Predictive power and parameter fitting

**Arjan Koning, IAEA**

**Technical Meeting on Nuclear data for Medical Applications,  
August 28-31 2023, IAEA**

# Introduction

- TALYS
- Global assessment of experimental data and outlier assignment
- Consistent and automated parameter fitting
- Special case:  $\text{Th}232(p,x)\text{Ac}225$
- Conclusions

# TALYS

Input

projectile n  
element Fe  
mass 56  
energy 14.0

~ 400 keywords

Physical parameters

## Nuclear Structure (RIPL-3)

- Masses
- Discrete levels
- Level densities
- Resonance parameters
- Photon strength functions
- Optical model parameters
- Fission barrier parameters

## Other

- Fission fragment distributions
- 'Best' nuclear model parameters optimised to experimental reaction data
  
- Phenomenological parameters
- Microscopic tables

Reaction models

## Optical model (ECIS)

- Local/global OMP
- Phenomenological
- Semi-microscopic (JLM)

## Direct reaction

- Spherical OMP
- DWBA
- Coupled-channels
  - Rotational
  - Vibrational
- Giant resonances
- Weak-coupling

## Compound reactions

- Hauser-Feshbach
- Width fluctuations
- Blatt-Biedenharn ang. dis.
- Particle, photon and fission transmission coeff.

## $\gamma$ -ray emission Pre-equilibrium reactions

- Exciton model
- Particle hole level density
- Kalbach systematics
  - Angular distribution
  - Cluster emission
- $\gamma$ -ray emission

Multiple emission

## Multiple emission

- Hauser-Feshbach
- Multiple preeq. exciton
- Fission competition
- $\gamma$ -ray cascade
- Exclusive channels
- Recoils
- Fission fragment de-excitation

Output

Output files per reaction channel

- Cross sections
  - Total
  - Exclusive: (n, $\gamma$ ), (n,f), (n,n'), (n,2n), (n,p) etc.
  - Per level
- Residual production
- Particle production
- $\gamma$ -ray production
- Emission spectra
  - Single-differential
  - Double differential
  - Recoils
- Angular distributions
  - Elastic
  - Per level
- Particle multiplicities
- Fission yields, neutron observables
- Astrophysical reaction rates, MACS
- ...etc

# TALYS: modeling of nuclear reactions

This is now the basic reference  
for TALYS

Communicated by Nicolas Alamanos

**Abstract** TALYS is a software package for the simulation of nuclear reactions below 200 MeV. It is used worldwide for the analysis and prediction of nuclear reactions and is based on state-of-art nuclear structure and nuclear reaction models. A general overview of the implemented physics and capabilities of TALYS is given. The general nuclear reaction mechanisms described are the optical model, direct reactions, compound nucleus model, pre-equilibrium reactions and fission. The most important nuclear structure models are those for masses, discrete levels, level densities, photon strength functions and fission barriers. A wide variety of nuclear reactions simulated with TALYS will be demonstrated, ranging from low-energy neutron cross sections, astrophysics, high-energy charged particle reactions and other reactions. TALYS is a nuclear reaction software which aims to give a complete description of nuclear reaction observables, and to be an important link between fundamental nuclear physics and applications.

# TALYS around the World (status 2022)

- Around 5500 citations (web of sciences)

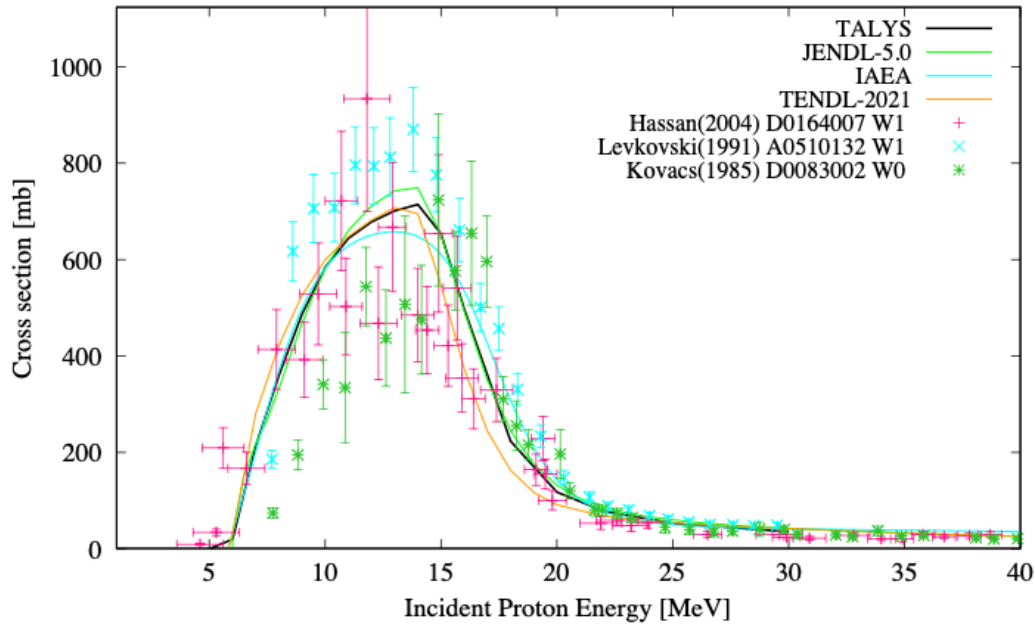

# Zero-ing in on the truth

- Run TALYS for all projectiles, nuclides and energies with global settings
- Compare with the **entire** EXFOR database
  - Computational access to EXFORtables: directory-structured database with E-dE-xs-dxs data per measurement (from XC5 file, Viktor Zerkin)
  - Automatic normalisation to new monitor and decay data
  - Assign outliers in EXFOR (**Exforcism**)
    - comparison with nuclear data libraries,
    - comparison with TALYS
    - comparison with other experimental data sets
    - quantify historical evaluator's opinion in consistent metadata
- Assess predictive power of TALYS as a function of energy, reaction channel and mass range
- Zoom in on specific reaction channel with automated optimisation, varying a restricted set of TALYS parameters

$^{76}\text{Se}(p,n)^{76}\text{Br}$  GOF= 1.22

W0: outlier-by-eye

Challenge: EXFOR data may be hidden under different reaction identifiers. Completeness of experimental data from EXFOR to EXFORtables not ensured, some data sets may be missing.

$^{44}\text{Ca}(p,n)^{44}\text{Sc}$  GOF= 1.18

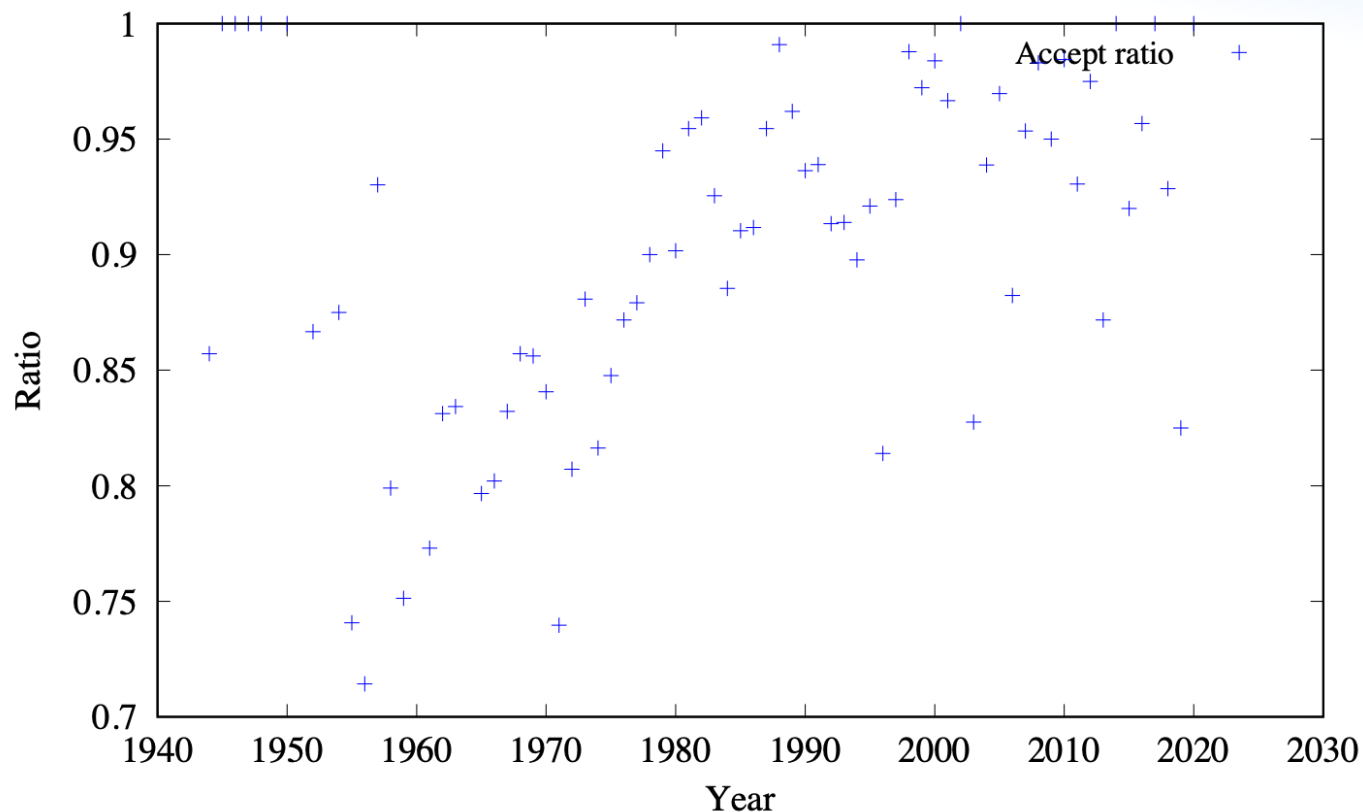

# 8400 JSON outlier/inlier files, one per EXFOR subentry

# EXFOR outlier assignment

Inclusion ratio: 7500 experimental data sets

Summed over all  $(n,g)$ ,  $(n,f)$ ,  $(n,n')$ ,  $(n,2n)$ ,  $(n,p)$ ,  $(n,a)$ ,  $(p,n)$ ,  $(g,n)$ ,  $(a,n)$ ,  $(d,n)$  reactions we could mine from EXFOR. 6500 accepts, 1000 rejects

# EXFOR outlier assignment: a learning curve?

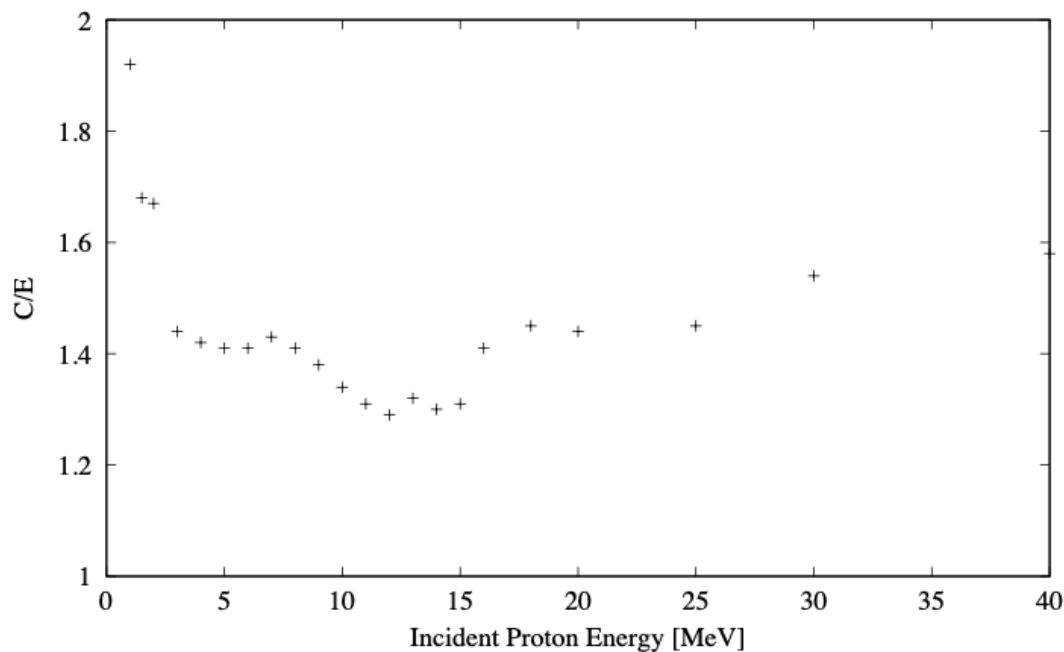

Inclusion ratio: 7500 experimental data sets (7 year average)

Other analyses possible:

- per reaction channel
- per author, co-author, lab, etc (probably should not publish THAT)
- per incident energy (e.g. 14 MeV)
- re-insert this as prior in the next Bayesian update

## TENDL-2021 (Global TALYS) versus 687 (p,n) exp. data sets

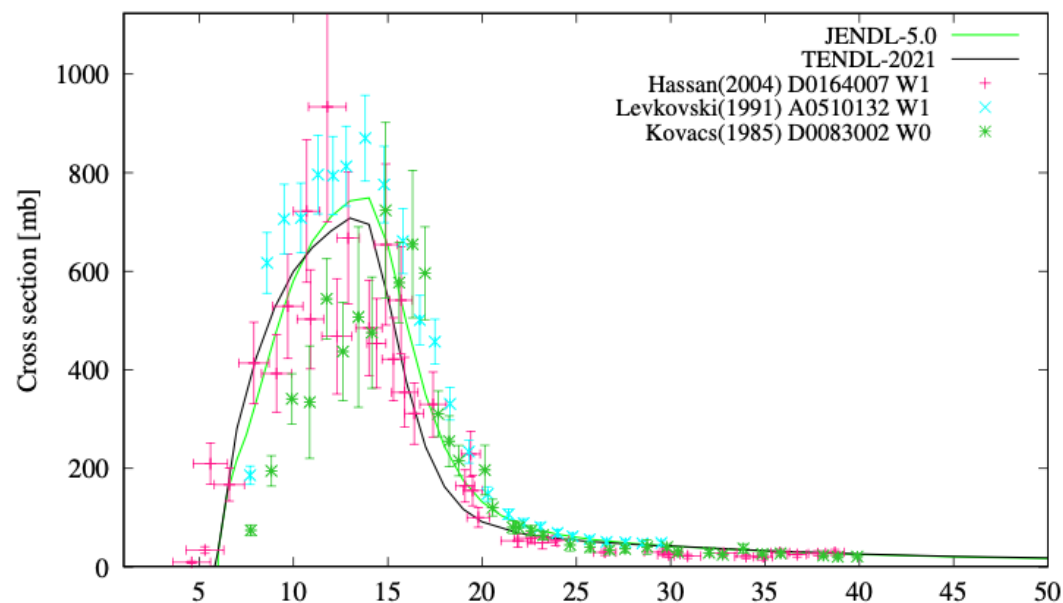

Global predictive power for  
(p,n): ~30% around the peak

(p,2n): ~40%

(alpha,n): ~45%

(d,n): ~60%

Common trend for all threshold reactions. Relative deviation is

- Large near threshold ( $> 2$ )
- Small near peak
- Larger in the tail

Global predictive power is energy dependent

# (p,n): several nuclides with JENDL-5 evaluation

$^{90}\text{Zr}(p,n)^{90}\text{Nb}$  GOF= 1.156

# TALYS parameters for optimization

# Actinides: uncertainty due to fission

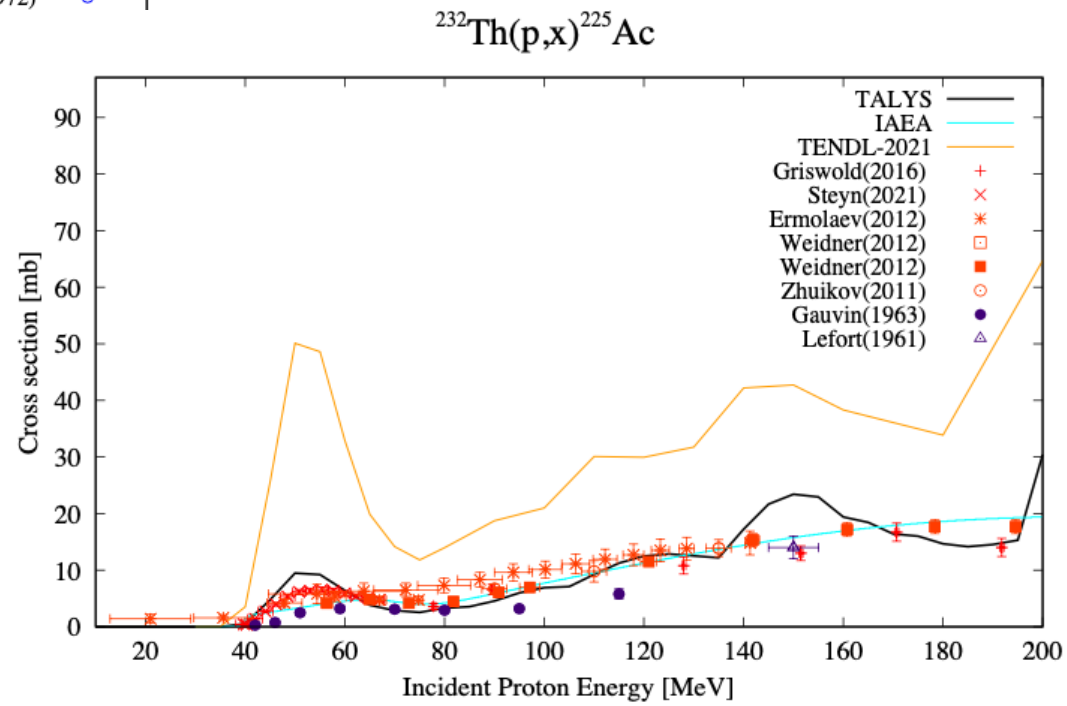

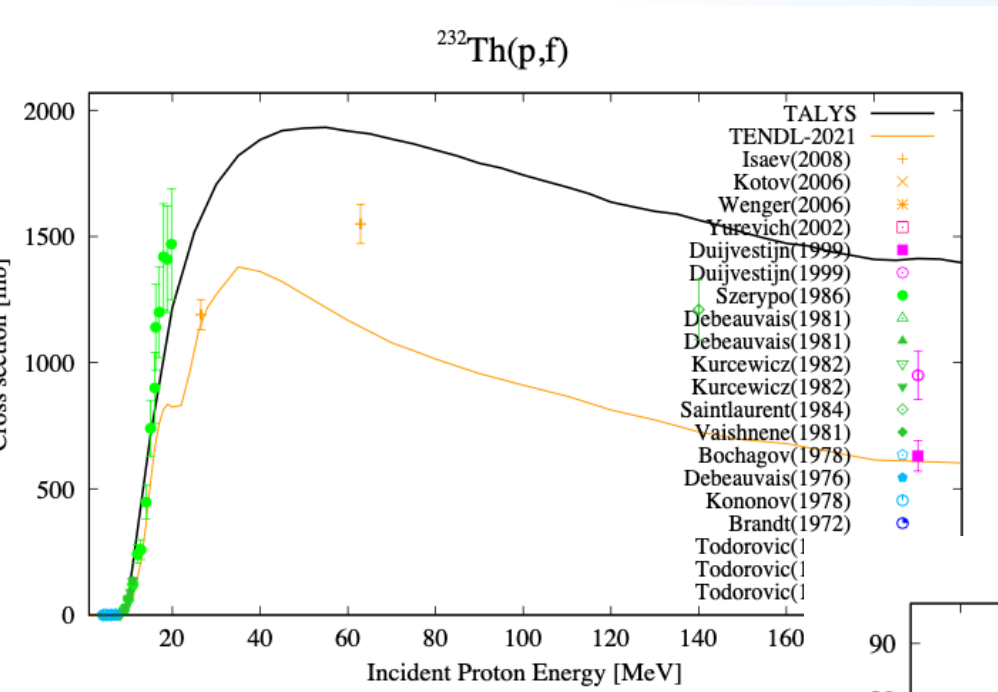

TALYS input file:

```
projectile p
element Th
mass 232
energy 10. 200. 5.
partable y
bins 100
Cbarrier 0.92
```

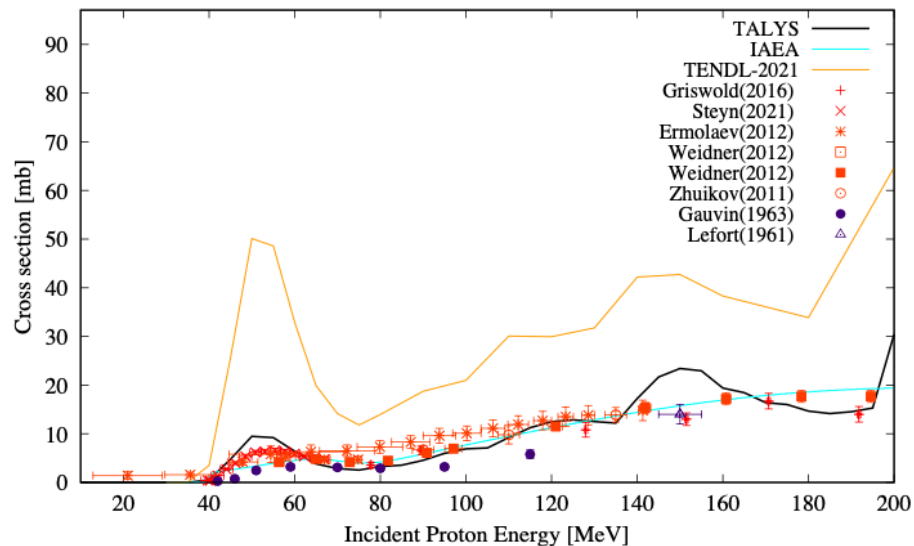

TALYS-2: one parameter 'Cbarrier' to reduce/increase all fission barriers

# Th232(p,f) could be higher compared to TENDL-2021

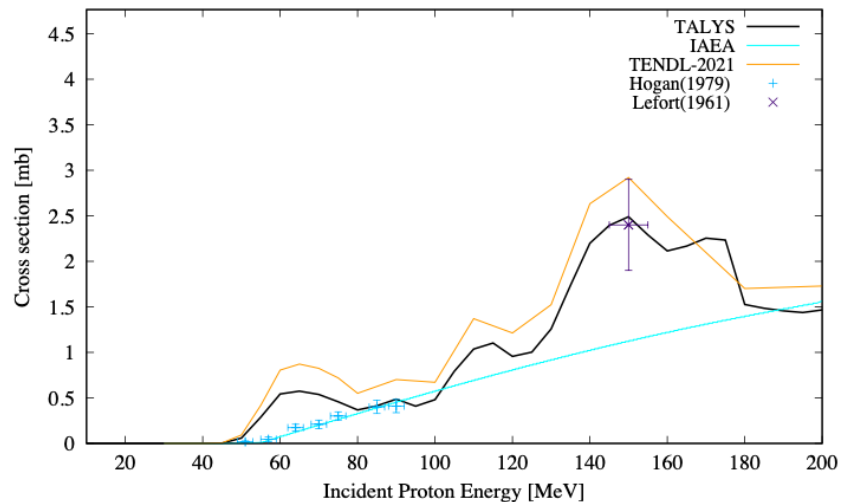

# Consistency with neighbouring channels 60 Years Atoms for Peace and Development

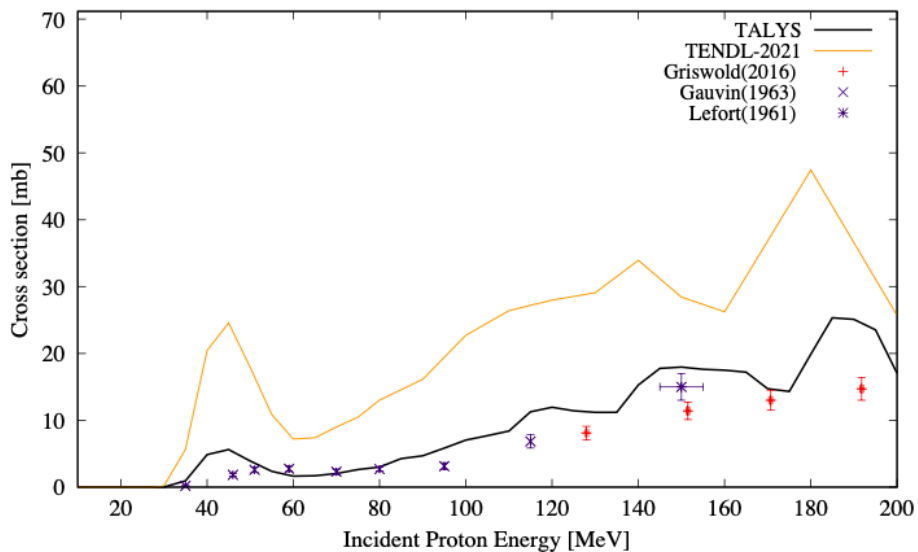

$^{232}\text{Th}(p,x)^{225}\text{Ac}$

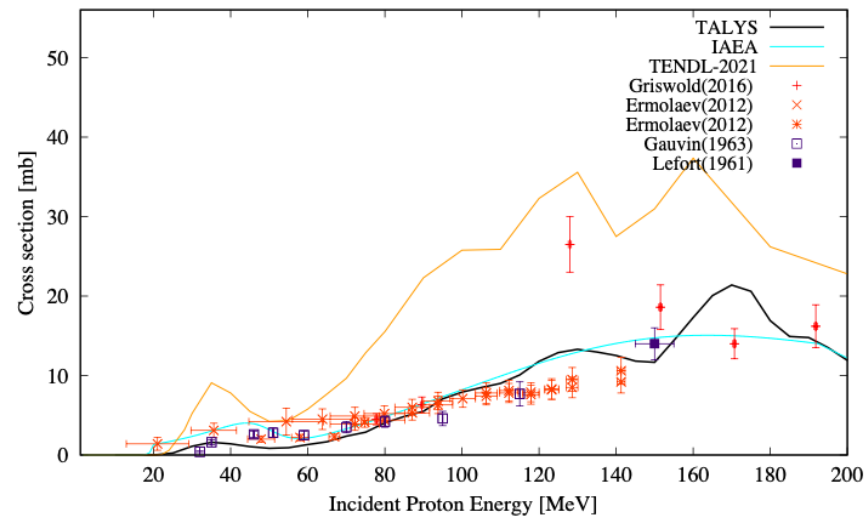

$^{232}\text{Th}(p,x)^{225}\text{Ra}$

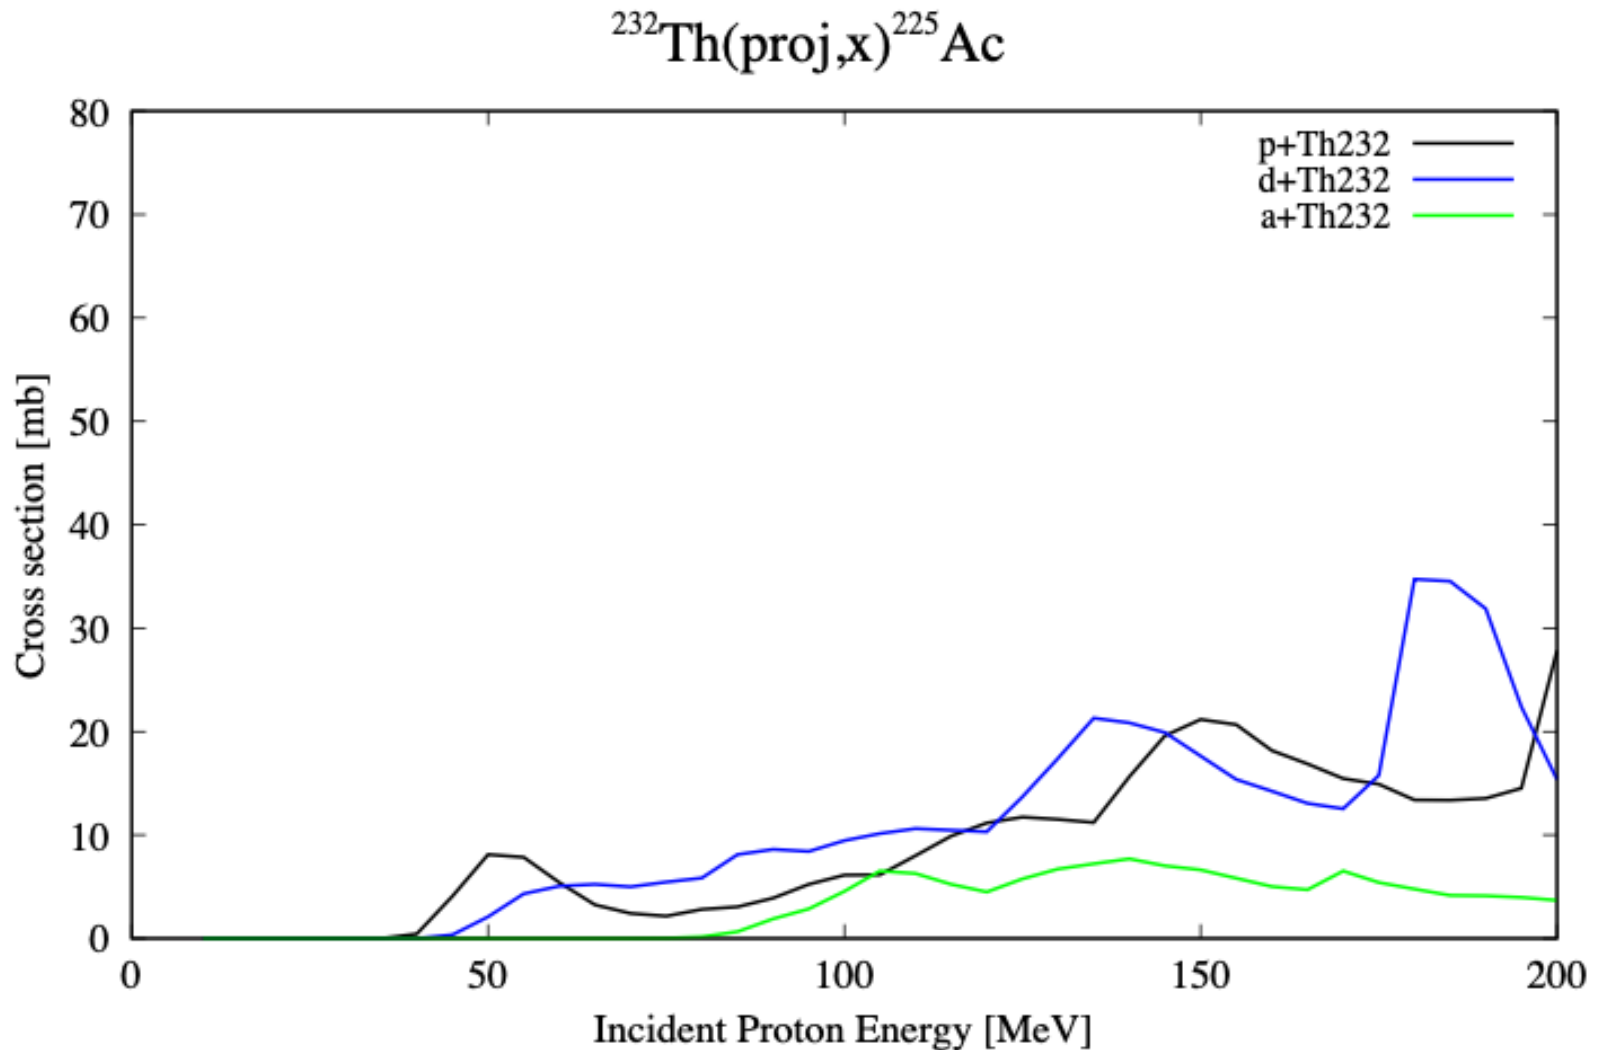

$^{232}\text{Th}(p,x)^{226}\text{Ac}$

$^{232}\text{Th}(p,x)^{227}\text{Ac}$

# Other projectiles?

# Conclusions

- TALYS a stable and well-tested (thanks to you!) tool for reasonable to good predictions up to 200 MeV
- TALYS-2 will be released in December 2023
- Automated optimisation to many reaction channels with a relatively small number of TALYS parameters
  - Requires computational access to entire EXFOR database at once
  - Requires extensive outlier database
- TENDL-2023 will contain optimised excitation functions
