

Move fast and secure things

OWASP

The Open Web Application Security Project

OWASP

The Open Web Application Security Project

\$whoami

- Security engineer @ Fb > 2 years
- Security consultant
- I <3 CTFs (LC/BC)
- I <3 server side bugs and automating the detection
- @the_st0rm

OWASP

The Open Web Application Security Project

- Agenda
 - Setting the scene
 - Securing the codebase
 - Example of rules
 - Static analysis use cases
 - Myth busting
 - Demo! :O

OWASP

OWASP

The Open Web Application Security Project

**“Nothing at Facebook
is somebody else's problem”**

OWASP

The Open Web Application Security Project

- Securing the codebase
 - Secure frameworks
 - Security reviews
 - Automation (static and dynamic analysis)
 - Whitehat

OWASP

The Open Web Application Security Project

- Secure frameworks
 - XHP
 - Hack
 - Django
- Limitations
 - Enforcement
 - Depends on the engineer

OWASP

The Open Web Application Security Project

- Manual security reviews
 - Find cool bugs
- Limitations
 - Time consuming
 - Does not scale
 - Completeness

OWASP

The Open Web Application Security Project

- Automation (Program analysis)
 - Scales
 - Find low hanging fruits
 - And difficult bugs (Fuzzing)
 - Continuous detection [+ prevention]
- Limitations
 - False positives and negatives
 - Difficult to get right

OWASP

The Open Web Application Security Project

- Whitehat
 - Continuous detection
 - Very unique bugs/talent
- Limitations
 - Test in prod!
 - Expensive for small companies?
 - Signal to noise ratio

OWASP

The Open Web Application Security Project

Automation (static analysis)

OWASP

The Open Web Application Security Project

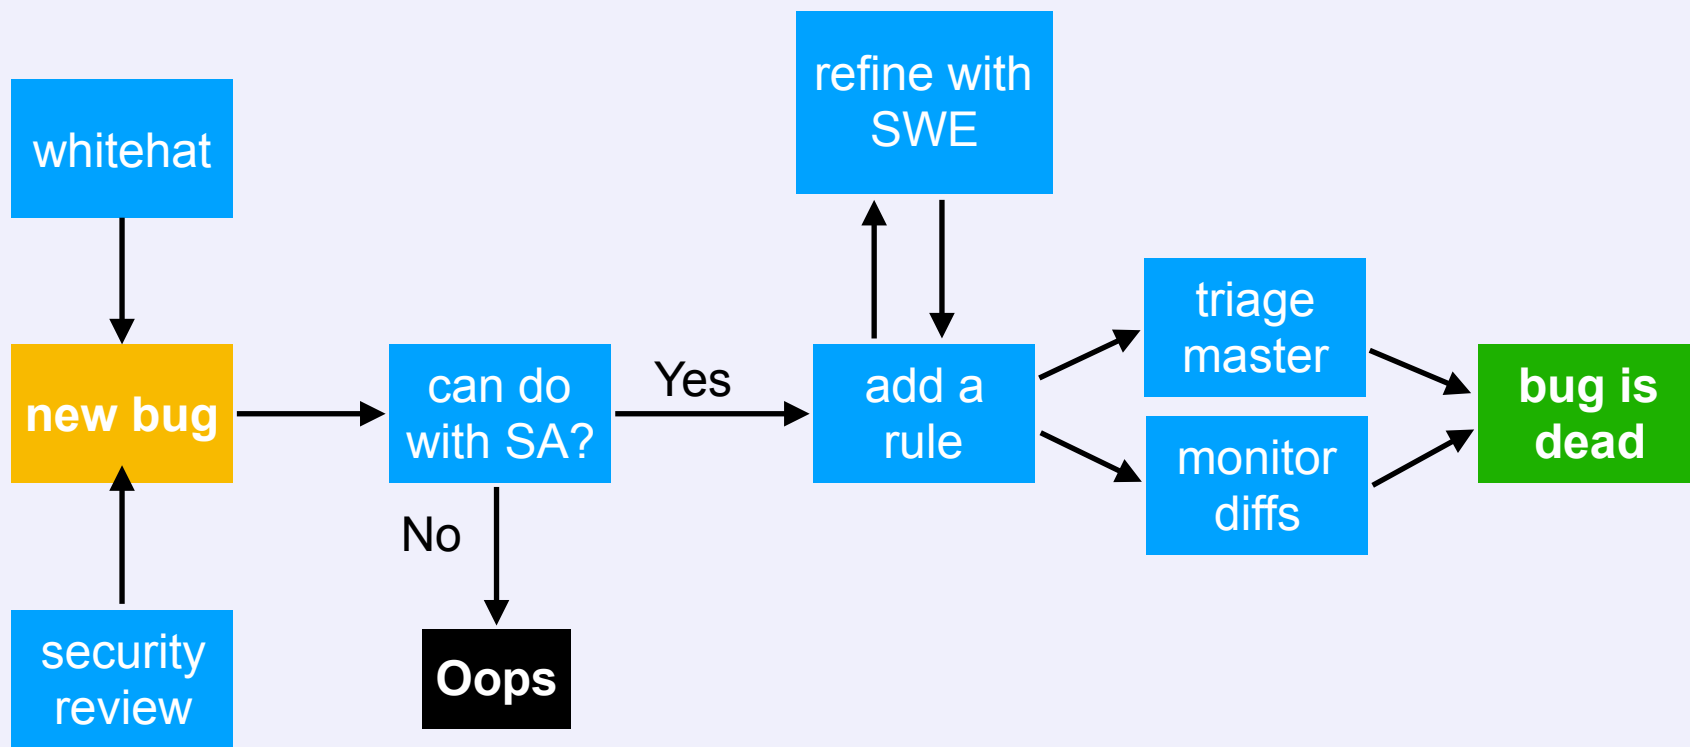

- Automation (static analysis)
 - Scale
 - Tens of millions LoC
 - Thousand commits/day
 - Performance
 - No run-time overhead (e.g fuzzing)
 - Grepping millions of LoC
 - Completeness
 - Proactive vs Reactive

OWASP

The Open Web Application Security Project

- Static analysis design

OWASP

The Open Web Application Security Project

- Tips to build good static analysis
 - Coverage
 - Understand the attack surface
 - Define sources
 - Define sinks
 - Simplicity
 - Easy to use
 - Configuring the sources/sinks
 - Adding sanitizers

OWASP

The Open Web Application Security Project

- Tips to build good static analysis
 - Improving signal
 - Excluding False positives
 - Finding false negatives
 - Feedback to the framework
 - Speed

OWASP

The Open Web Application Security Project

- Security vulnerabilities we detect
 - We can currently detect more than 20 types of security issues including
 - Higher-order command injection
 - HTTP status codes as privacy oracles
 - Arbitrary file reads/writes
 - Server-side Request Forgery (SSRF)
 - SQL
 - XSS

OWASP

The Open Web Application Security Project

- Bug detection - Arbitrary file reads/writes
 - Filename going to dangerous function

```
$path = $_FILES['upfile']['name'];  
// ...  
Filesystem::readFile($path);
```

```
$path = $_FILES['upfile']['tmp_name'];  
// ...  
Filesystem::readFile($path);
```

OWASP

The Open Web Application Security Project

- Bug detection - command injection
- Secure because of high-quality frameworks

```
$t = attacker_controlled();  
// ... many lines ...  
execx("zip %s", $t);
```

```
$t = attacker_controlled();  
// ...  
execx("zip a.zip -T '--unzip-command=%s'", $t);
```

- Commands can execute other commands

- Static analysis tool can understand format string

--unzip-command cmd

Use `cmd` instead of `unzip` to test an application when the `unzip` function is used. On Unix, to use a copy of `unzip` in the current directory instead of the standard system `unzip`, could use:

```
zip archive file1 file2 -T -TT "./unzip -tqq"
```

In `cmd`, `{}` is replaced by the name of the temporary archive, otherwise the name of the archive is appended to the end of the command. The return code is checked for success (0 on Unix).

OWASP

The Open Web Application Security Project

- Bug detection - Privacy oracles

- Static analysis can check

- action taken under attacker control?
- action is influenced by privacy check?

```
$group_id = attacker_controlled();  
if ($group_id === 100)  
    throw HTTP_404();
```

```
$group_id = attacker_controlled();  
// Load with privacy check  
$data = isMember(auth_user(), group_id);  
if ($data === null)  
    throw HTTP_404();
```

OWASP

The Open Web Application Security Project

- Use cases
 - Regular analysis
 - Triaged by security engineers
 - Triaged by team owners
 - On-demand analysis
 - Whitehat report
 - Security reviews

OWASP

The Open Web Application Security Project

- Use cases
 - Diff analysis
 - Analyze base repo
 - Analyze base repo + diff
 - Find new issues
 - High confidence issues => auto comment
 - Mid confidence => Oncall/product team

OWASP

The Open Web Application Security Project

- Myth busting
 - Does it scale?
 - 20 mins for 10s millions of LoC
 - Is it precise?
 - “Static analyzers are noisy”
 - Is it useful?
 - “They only find trivial errors”

OWASP

The Open Web Application Security Project
