

Chrome Enterprise Recommended Solution Overview with Ping Identity

Secure and seamless access for any user to any resource

Today's users need access to the applications and resources required for their job, regardless of where they work. The combination of Ping Identity with Chrome Enterprise allows for a better user experience without compromising security.

Ping Identity provides comprehensive cross-platform capabilities for secure authentication with Chrome Enterprise.

Users can now authenticate directly from their ChromeOS, MacOS or Windows device with Ping Identity — ensuring secure authentication, provisioning, and multi-factor authentication to the applications and tools they need.

By combining Ping's user context and risk signals with Chrome Enterprise's device signals, security teams can build enhanced policies. These policies can ensure users are requesting access from a managed browser, are given a step-up for multi-factor authentication (MFA), or denied access.

Discover the benefits

Create a seamless and secure user experience for everyone.

Cornerstone of secure browser and secure container authentication

- Provide seamless SSO to ChromeOS devices and cross-platform support via the Chrome browser
- Reset and Sync your ChromeOS and Active Directory Passwords
- Provision Users to GCP through Ping Identity
- Leverage MFA for strong authentication for Chrome browser and ChromeOS users
