

Bernstein-Bezier Techniques in High Order Finite Elements

Mark Ainsworth

Division of Applied Mathematics

Brown University

Mark_Ainsworth@brown.edu

BROWN

Outline

- Bernstein-Bezier Polynomials
- De Casteljau Algorithm
- Sum-Factorisation and AAD Algorithm
- Bernstein-Bezier Basis for Raviart-Thomas Elements
- Applications

Nomenclature

$$\mathcal{I}_n = \{ \alpha \in \mathbb{Z}_+^3 : |\alpha| = n \}$$

'Multi-Indices'

'Domain Points'

$$x_\alpha = \frac{1}{n} \sum_{k=1}^3 \alpha_k x_k$$

Case: $n=4$

BROWN

Bernstein-Bezier Polynomials

$$B_{\alpha}^n(\mathbf{x}) = \binom{n}{\alpha} \lambda^{\alpha}, \quad \alpha \in \mathcal{I}_n$$

$\lambda = (\lambda_1, \lambda_2, \lambda_3)$ barycentric coordinates

Non-negative, partition of unity $\sum_{\alpha \in \mathcal{I}_n} B_{\alpha}^n = 1$.

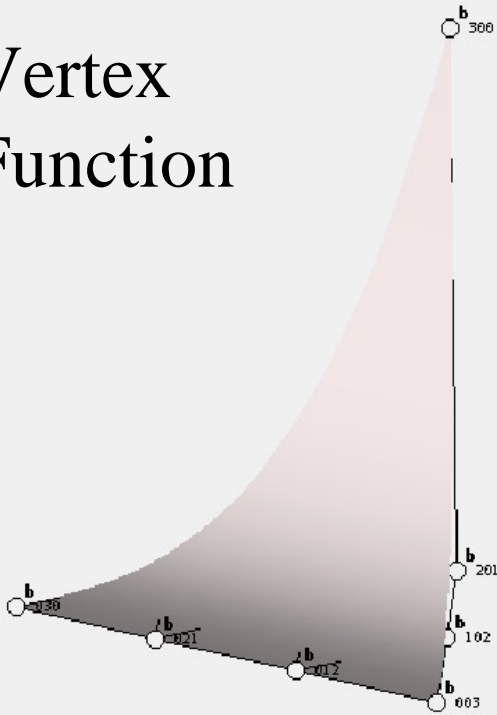

Natural identifications:

$$B_{\alpha}^n(\mathbf{x}) \longleftrightarrow \mathbf{x}_{\alpha} \longleftrightarrow \alpha \in \mathcal{I}_n$$

BROWN

Why Bernstein-Bezier?

- Elegant, efficient and stable algorithms. e.g. de Casteljau, ...
- Industry standard for graphics. e.g. psfonts defined as Bezier curves, CAD/CAM packages use Bezier extensively.
- Industry standard for graphics hardware. e.g. OpenGL hardware optimised routines to render Bezier curves and surfaces.

Some Nice Properties of Bernstein Polynomials

$$\int_T B_{\alpha}^n(\mathbf{x}) d\mathbf{x} = \frac{|T|}{\binom{n+d}{d}}, \quad \alpha \in \mathcal{I}_d^n$$

$$B_{\alpha}^m B_{\beta}^n = \frac{\binom{\alpha+\beta}{\alpha}}{\binom{m+n}{m}} B_{\alpha+\beta}^{m+n}, \quad \alpha \in \mathcal{I}_d^m, \beta \in \mathcal{I}_d^n$$

De Casteljau Algorithm ($n=1$)

How to evaluate BB poly ($n=1$) at x ?

BROWN

De Casteljau Algorithm ($n=1$)

Replace coordinates by control points

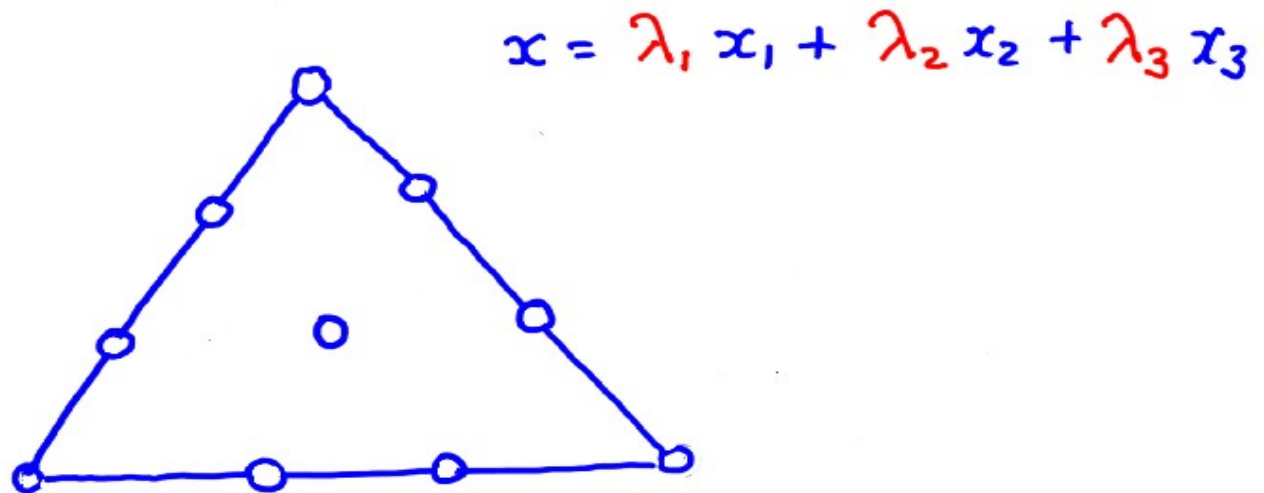

... simply linear interpolation.

BROWN

De Casteljau Algorithm ($n=3$)

How to evaluate BB poly ($n=3$) at x ?

BROWN

De Casteljau Algorithm ($n=3$)

$$x = \lambda_1 x_1 + \lambda_2 x_2 + \lambda_3 x_3$$

Introduce (virtual) micro-mesh

BROWN

De Casteljau Algorithm ($n=3$)

LOCAL linear interpolation (as for $n=1$)

BROWN

De Casteljau Algorithm ($n=3$)

$$x = \lambda_1 x_1 + \lambda_2 x_2 + \lambda_3 x_3$$

LOCAL linear interpolation (as for $n=1$)

BROWN

De Casteljau Algorithm ($n=3$)

$$x = \lambda_1 x_1 + \lambda_2 x_2 + \lambda_3 x_3$$

Form lattice from "new control points"

BROWN

De Casteljau Algorithm ($n=3$)

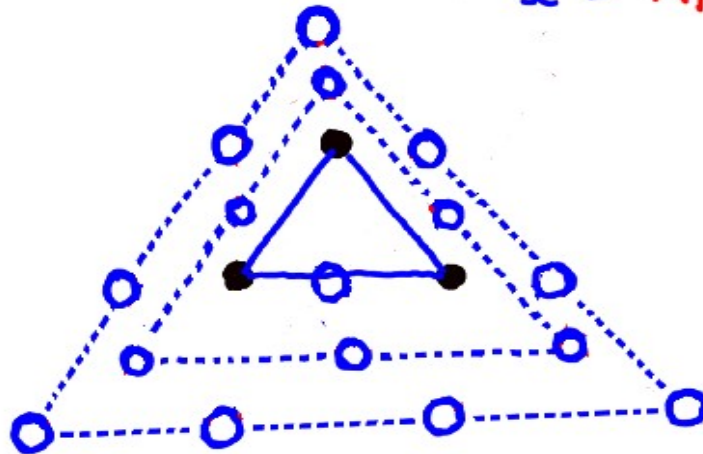

Perform **LOCAL** linear interpolation again

BROWN

De Casteljau Algorithm ($n=3$)

$$x = \lambda_1 x_1 + \lambda_2 x_2 + \lambda_3 x_3$$

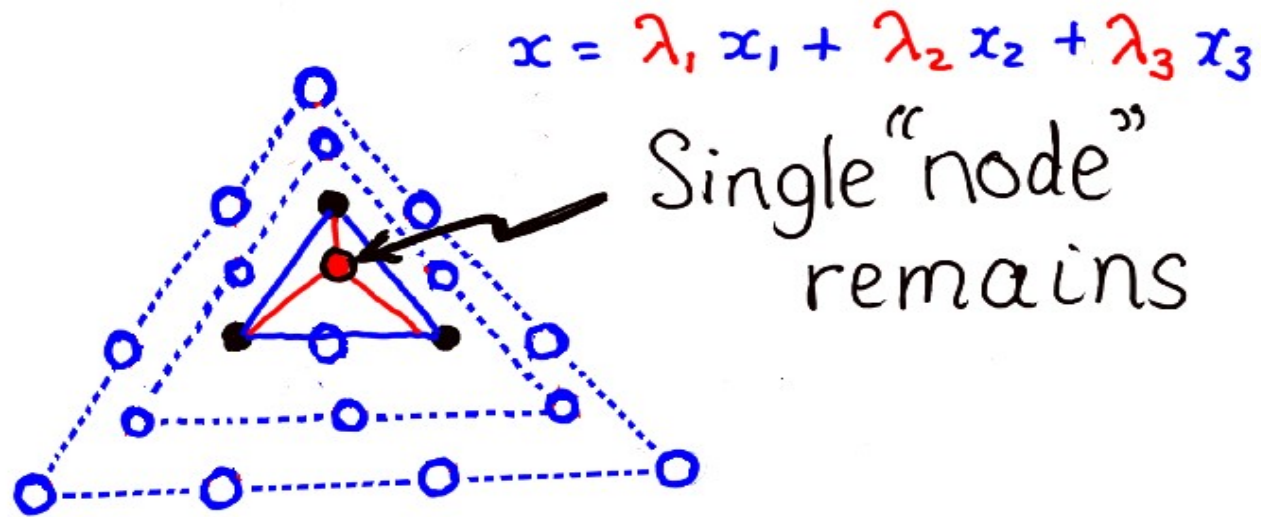

Form lattice from "new control points"

BROWN

De Casteljau Algorithm ($n=3$)

Perform linear interpolation again

BROWN

De Casteljau Algorithm ($n=3$)

Gives the value of cubic BB poly at x

BROWN

De Casteljau Algorithm ($n=3$)

Stacking the arrays \Rightarrow Pyramid Algorithm

BROWN

BOOK: R. Goldman, *Pyramid Algorithms: A Dynamic Programming Approach to Curves and Surfaces for Geometric Modeling.*

Question

We consider following simple question:

what advantages do Bernstein polynomials offer

BROWN

Question

We consider following simple question:

what advantages do Bernstein polynomials offer (if any)

BROWN

Question

We consider following simple question:

what advantages do Bernstein polynomials offer (if any) for high order FEM?

BROWN

Question

We consider following simple question:

what advantages do Bernstein polynomials offer (if any) for high order FEM?

Question motivated by:

- almost ubiquitous use of Bernstein polys in CAGD community
- ... and in spline literature.
- Similar philosophy to IGA (Hughes et al.)

BROWN

Bernstein-Bezier H^1 FEM

Previous work on using Bernstein-Bezier basis
Awanou (PhD Thesis), Arnold et al. (2009), ...

BUT don't take advantage of special properties
of BB (could equally well use Lagrange basis).

Work seeking to exploit properties of BB:

* R.C. Kirby, *Numer. Math.*, (2011). Constant data, affine simplices in 2D/3D.

* Ainsworth, Andriamaro & Davydov, *SIAM J. Sci. Comp.*, (2011). Variable data, curvilinear elements, non-linear problems, simplices, prisms, bricks, ..., any dimension.

BROWN

Duffy Transformation

Define $\mathbf{x} : [0, 1]^d \rightarrow T = \text{conv}(\mathbf{x}_1, \dots, \mathbf{x}_{d+1})$ by rule

$$\mathbf{x}(\mathbf{t}) = \sum_{k=1}^{d+1} \lambda_k \mathbf{x}_k$$

where

$$\lambda_1 = t_1, \lambda_2 = t_2(1 - \lambda_1), \dots, \lambda_d = t_d(1 - \lambda_1 - \dots - \lambda_{d-1}).$$

BROWN

Ref: Duffy '81, Dubiner '92, warburton et al. '99

Stroud Conical Quadrature Rule

Duffy transformation gives

$$\int_T f(\mathbf{x}) \, d\mathbf{x} = d! |T| \int_0^1 dt_1 (1 - t_1)^{d-1} \int_0^1 dt_2 (1 - t_2)^{d-2} \cdots \int_0^1 dt_d (f \circ \mathbf{x})(\mathbf{t}).$$

Approximate integral over t_k variable by Gauss-Jacobi rule:

$$\int_0^1 (1 - s)^{d-k} g(s) \, ds \approx \sum_{j=1}^q \omega_j^{(d-k)} g(\xi_j^{(d-k)})$$

BROWN

Stroud Conical Quadrature Rule

Gives

$$\int_T f(\mathbf{x}) \, d\mathbf{x} \approx d! |T| \sum_{i_1=1}^q \omega_{i_1}^{(d-1)} \sum_{i_2=1}^q \omega_{i_2}^{(d-2)} \cdots \sum_{i_d=1}^q \omega_{i_d}^{(0)} f(\mathbf{x}_{i_1, i_2, \dots, i_d}).$$

"Stroud conical quadrature"

- positive quadrature weights
- quadrature nodes on T

$$\mathbf{x}_{i_1, i_2, \dots, i_d} = \mathbf{x}(\xi_{i_1}^{(d-1)}, \xi_{i_2}^{(d-2)}, \dots, \xi_{i_d}^{(0)})$$

$$1 \leq i_1, i_2, \dots, i_d \leq q.$$

BROWN

Bernstein Polynomials & Duffy

How does Bernstein polynomial behave under Duffy transformation? $\mathbf{x}(t) : [0, 1]^d \rightarrow T$

Consider univariate Bernstein polynomial

$$B_k^m(t) = \binom{m}{k} t^k (1-t)^{m-k}, k \in \{0, 1, \dots, m\}$$

then

$$B_{\alpha}^n(\mathbf{x}(t)) = B_{\alpha_1}^n(t_1) B_{\alpha_2}^{n-\alpha_1}(t_2) \cdots B_{\alpha_d}^{n-\alpha_1-\dots-\alpha_{d-1}}(t_d)$$

BROWN

Tensorial Nature

Bernstein Polynomials & Duffy

KEY OBSERVATION:

$$B_{\alpha}^n(\mathbf{x}(\mathbf{t})) = B_{\alpha_1}^n(t_1) B_{\alpha_2}^{n-\alpha_1}(t_2) \cdots B_{\alpha_d}^{n-\alpha_1-\dots-\alpha_{d-1}}(t_d)$$

Bernstein polynomials possess key property needed for *Sum Factorisation Algorithm*.

Ref. Orszag, 1980

BUT basis not tied to a tensorial construction.

BROWN

Application: Evaluation of BBFEM

How to *efficiently* evaluate a BBFEM approx
at all of Stroud points? $\mathbf{x}_{i_1, i_2, \dots, i_d}$

$$u(\mathbf{x}) = \sum_{\alpha \in \mathcal{I}_d^n} c_\alpha B_\alpha^n(\mathbf{x})$$

Application: Evaluation of BBFEM

How to *efficiently* evaluate a BBFEM approx at all of Stroud points? $\mathbf{x}_{i_1, i_2, \dots, i_d}$

$$u(\mathbf{x}) = \sum_{\alpha \in \mathcal{I}_d^n} c_\alpha B_\alpha^n(\mathbf{x})$$

Method 1: Apply de Casteljau Algorithm.

\Rightarrow Cost of $\mathcal{O}(n^{d+1})$ per point.

BROWN

Application: Evaluation of BBFEM

How to *efficiently* evaluate a BBFEM approx
at all of Stroud points? $\mathbf{x}_{i_1, i_2, \dots, i_d}$

$$u(\mathbf{x}) = \sum_{\alpha \in \mathcal{I}_d^n} c_\alpha B_\alpha^n(\mathbf{x})$$

Method 2: Apply sum factorisation.

BROWN

Application: Evaluation of BBFEM

$$(u \circ x)(t) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(t_1) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(t_2) \sum_{\alpha_3=0}^{n-\alpha_1-\alpha_2} B_{\alpha_3}^{n-\alpha_1-\alpha_2}(t_3) C_{\alpha_1, \alpha_2, \alpha_3}$$

using **KEY OBSERVATION**, where x is Duffy transformation.

BROWN

Application: Evaluation of BBFEM

$$(u \circ x)(t) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) \sum_{\alpha_3=0}^{n-\alpha_1-\alpha_2} B_{\alpha_3}^{n-\alpha_1-\alpha_2}(\xi_{i_3}^2) C_{\alpha_1 \alpha_2 \alpha_3}$$

where $t = (\xi_{i_1}^0, \xi_{i_2}^1, \xi_{i_3}^2)$,
 $0 \leq i_1, i_2, i_3 \leq q$

i.e. want to evaluate at Stroud points.

BROWN

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) \sum_{\alpha_3=0}^{n-\alpha_1-\alpha_2} B_{\alpha_3}^{n-\alpha_1-\alpha_2}(\xi_{i_3}^2) C_{\alpha_1 \alpha_2 \alpha_3}$$

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) \underbrace{\sum_{\alpha_3=0}^{n-\alpha_1-\alpha_2} B_{\alpha_3}^{n-\alpha_1-\alpha_2}(\xi_{i_3}^2) C_{\alpha_1, \alpha_2, \alpha_3}}_{\text{|| define } C^1(\alpha_1, \alpha_2, i_3)}$$

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) C'(\alpha_1, \alpha_2, i_3)$$

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) C^1(\alpha_1, \alpha_2, i_3)$$

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) \underbrace{\sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) C^1(\alpha_1, \alpha_2, i_3)}_{\parallel \text{ def}} C^2(\alpha_1, i_2, i_3)$$

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) C^2(\alpha_1, i_2, i_3)$$

Application: Evaluation of BBFEM

$$\begin{aligned} (u \circ x)(\underline{t}) &= \\ & \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) C^2(\alpha_1, i_2, i_3) \\ & \underbrace{\hspace{10em}}_{\parallel \text{ def}} \\ & C^3(i_1, i_2, i_3) \end{aligned}$$

Application: Evaluation of BBFEM

$$(u \circ x)(\underline{t}) = C^3(i_1, i_2, i_3)$$

$$\text{where } \underline{t} = (\xi_{i_1}^0, \xi_{i_2}^1, \xi_{i_3}^2)$$

$$0 \leq i_1, i_2, i_3 \leq q$$

Application: Evaluation of BBFEM

$$C^3(i_1, i_2, i_3) = \sum_{\alpha_1=0}^{\pi} B_{\alpha_1}^{\pi}(\xi_{i_1}^0) C^2(\alpha_1, i_2, i_3)$$

$$0 \leq i_1, i_2, i_3 \leq q$$

BROWN

Application: Evaluation of BBFEM

$$C^2(\alpha_1, i_2, i_3) = \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) C^1(\alpha_1, \alpha_2, i_3)$$

$$C^3(i_1, i_2, i_3) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) C^2(\alpha_1, i_2, i_3)$$

$$0 \leq i_1, i_2, i_3 \leq q$$

Application: Evaluation of BBFEM

$$C^2(\alpha_1, i_2, i_3) = \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) C^1(\alpha_1, \alpha_2, i_3)$$

$$C^3(i_1, i_2, i_3) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) C^2(\alpha_1, i_2, i_3)$$

$$0 \leq i_1, i_2, i_3 \leq q$$

BROWN

Application: Evaluation of BBFEM

$$C^1(\alpha_1, \alpha_2, i_3) = \sum_{\alpha_3=0}^{n-\alpha_1-\alpha_2} B_{\alpha_3}^{n-\alpha_1-\alpha_2}(\xi_{i_3}^2) C_{\alpha_1 \alpha_2 \alpha_3}$$

(Given) control points

$$C^2(\alpha_1, i_2, i_3) = \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^1) C^1(\alpha_1, \alpha_2, i_3)$$

$$C^3(i_1, i_2, i_3) = \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_1}^0) C^2(\alpha_1, i_2, i_3)$$

$$0 \leq i_1, i_2, i_3 \leq q$$

Application: Evaluation of BBFEM

$$\begin{aligned}
 C^1(\alpha_1, \alpha_2, i_3) &= \sum_{\alpha_3=0}^{n-\alpha_1-\alpha_2} B_{\alpha_3}^{n-\alpha_1-\alpha_2} \left(\sum i_3^2 \right) C_{\alpha_1 \alpha_2 \alpha_3} \\
 C^2(\alpha_1, i_2, i_3) &= \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1} \left(\sum i_2^1 \right) C^1(\alpha_1, \alpha_2, i_3) \\
 C^3(i_1, i_2, i_3) &= \sum_{\alpha_1=0}^n B_{\alpha_1}^n \left(\sum i_1^0 \right) C^2(\alpha_1, i_2, i_3)
 \end{aligned}$$

$$0 \leq i_1, i_2, i_3 \leq q$$

Application: Evaluation of BBFEM

Step 1: Apply **KEY OBSERVATION** to write

$$(u \circ x)(\mathbf{t}) =$$

$$\sum_{\alpha_1=0}^n B_{\alpha_1}^n(t_1) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(t_2) \cdots \sum_{\alpha_d=0}^{n-\alpha_1-\dots-\alpha_{d-1}} B_{\alpha_d}^{n-\alpha_1-\dots-\alpha_{d-1}}(t_d)$$

BROWN

Application: Evaluation of BBFEM

Step 1: Apply **KEY OBSERVATION** to write

$$(u \circ x)(t) =$$

$$\sum_{\alpha_1=0}^n B_{\alpha_1}^n(t_1) \sum_{\alpha_2=0}^{n-\alpha_1} B_{\alpha_2}^{n-\alpha_1}(t_2) \cdots \sum_{\alpha_d=0}^{n-\alpha_1-\cdots-\alpha_{d-1}} B_{\alpha_d}^{n-\alpha_1-\cdots-\alpha_{d-1}}(t_d)$$

Step 2: Express in recursive form

$$\begin{aligned} C^0(\alpha_1, \dots, \alpha_{d-1}, \alpha_d) &= c_{\alpha_1, \dots, \alpha_{d-1}, \alpha_d} \\ C^1(\alpha_1, \dots, \alpha_{d-1}, i_d) &= \sum_{\alpha_d=0}^{n-\alpha_1-\cdots-\alpha_{d-1}} B_{\alpha_d}^{n-\alpha_1-\cdots-\alpha_{d-1}}(\xi_{i_d}^{(0,0)}) C^0(\alpha_1, \alpha_2, \dots, \alpha_d) \\ C^2(\alpha_1, \dots, i_{d-1}, i_d) &= \sum_{\alpha_{d-1}=0}^{n-\alpha_1-\cdots-\alpha_{d-2}} B_{\alpha_{d-1}}^{n-\alpha_1-\cdots-\alpha_{d-2}}(\xi_{i_{d-1}}^{(1,0)}) C^1(\alpha_1, \dots, \alpha_{d-1}, i_d) \\ &\vdots \\ C^d(i_1, \dots, i_{d-1}, i_d) &= \sum_{\alpha_1=0}^n B_{\alpha_1}^n(\xi_{i_d}^{(d-1,0)}) C^{d-1}(\alpha_1, \dots, i_{d-1}, i_d) \end{aligned}$$

BROWN

Application: Evaluation of BBFEM

Recursion leads to

$$u(\mathbf{x}_{i_1, \dots, i_{d-1}, i_d}) = C^d(i_1, \dots, i_{d-1}, i_d)$$

at total cost for *all* points of

$$\mathcal{O}(n^{d+1})$$

BROWN

Application: Evaluation of BBFEM

Recursion leads to

$$u(\mathbf{x}_{i_1, \dots, i_{d-1}, i_d}) = C^d(i_1, \dots, i_{d-1}, i_d)$$

at total cost for **all** points of

$$\mathcal{O}(n^{d+1})$$

i.e. we get **all points at same cost** for de
Casteljau to get a single point.

BROWN

Application: Evaluation of BBFEM

Recursion leads to

$$u(\mathbf{x}_{i_1, \dots, i_{d-1}, i_d}) = C^d(i_1, \dots, i_{d-1}, i_d)$$

at total cost for **all** points of

$$\mathcal{O}(n^{d+1})$$

i.e. we get **all points at same cost** for de
Casteljau to get a single point.

... including the cost of evaluating basis
functions 'on the fly'.

BROWN

Evaluation of Moments

Bernstein-Bezier Moments of f defined by

$$\mu_{\alpha}^n(f) = \int_T B_{\alpha}^n(\mathbf{x}) f(\mathbf{x}) d\mathbf{x}, \quad \alpha \in \mathcal{I}_d^n.$$

... needed for element load vector.

Evaluation of Moments

Bernstein-Bezier Moments of f defined by

$$\mu_{\alpha}^n(f) = \int_T B_{\alpha}^n(\mathbf{x}) f(\mathbf{x}) d\mathbf{x}, \quad \alpha \in \mathcal{I}_d^n.$$

... needed for element load vector.

If data f constant, then have simple closed form

$$\mu_{\alpha}^n(f) = \frac{|T|}{\binom{n+d}{d}} f|_T, \quad \alpha \in \mathcal{I}_d^n$$

Evaluation of Moments

Bernstein-Bezier Moments of f defined by

$$\mu_{\alpha}^n(f) = \int_T B_{\alpha}^n(\mathbf{x}) f(\mathbf{x}) d\mathbf{x}, \quad \alpha \in \mathcal{I}_d^n.$$

... needed for element load vector.

General data: need quadrature rule with $\mathcal{O}(q^d)$

Points where $q = \mathcal{O}(n)$

Total of $\mathcal{O}(n^d)$ moments \Rightarrow potentially costly.

BROWN

Evaluation of Moments

Duffy transformation and **KEY OBSERVATION** gives

$$\begin{aligned}\mu_{\alpha}^n(f) = & d! |T| \int_0^1 dt_d B_{\alpha_d}^{n-\alpha_1-\dots-\alpha_{d-1}}(t_d) \\ & \cdot \int_0^1 dt_{d-1} (1-t_{d-1}) B_{\alpha_{d-1}}^{n-\alpha_1-\dots-\alpha_{d-2}}(t_{d-1}) \\ & \dots \\ & \cdot \int_0^1 dt_1 (1-t_1)^{d-1} B_{\alpha_1}^n(t_1)(f \circ \mathbf{x})(\mathbf{t})\end{aligned}$$

Evaluation of Moments

Apply Stroud conical quadrature rule to obtain recursive formulae:

$$\begin{aligned} F^0(i_1, i_2, \dots, i_d) &= (f \circ \mathbf{x})(\xi_{i_1}^{(d-1)}, \xi_{i_2}^{(d-2)}, \dots, \xi_{i_d}^{(0)}) \\ F^1(\alpha_1, i_2, \dots, i_d) &= \sum_{i_1=1}^q \omega_{i_1}^{(d-1)} B_{\alpha_1}^n(\xi_{i_1}^{(d-1)}) F^0(i_1, i_2, \dots, i_d) \\ F^2(\alpha_1, \alpha_2, \dots, i_d) &= \sum_{i_2=1}^q \omega_{i_2}^{(d-2)} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^{(d-2)}) F^1(\alpha_1, i_2, \dots, i_d) \\ &\vdots \\ F^d(\alpha_1, \alpha_2, \dots, \alpha_d) &= \sum_{i_d=1}^q \omega_{i_d}^{(0)} B_{\alpha_d}^{n-\alpha_1-\dots-\alpha_{d-1}}(\xi_{i_d}^{(0)}) F^{d-1}(\alpha_1, \alpha_2, \dots, \end{aligned}$$

Evaluation of Moments

Apply Stroud conical quadrature rule to obtain recursive formulae:

$$\begin{aligned} F^0(i_1, i_2, \dots, i_d) &= (f \circ \mathbf{x})(\xi_{i_1}^{(d-1)}, \xi_{i_2}^{(d-2)}, \dots, \xi_{i_d}^{(0)}) \\ F^1(\alpha_1, i_2, \dots, i_d) &= \sum_{i_1=1}^q \omega_{i_1}^{(d-1)} B_{\alpha_1}^n(\xi_{i_1}^{(d-1)}) F^0(i_1, i_2, \dots, i_d) \\ F^2(\alpha_1, \alpha_2, \dots, i_d) &= \sum_{i_2=1}^q \omega_{i_2}^{(d-2)} B_{\alpha_2}^{n-\alpha_1}(\xi_{i_2}^{(d-2)}) F^1(\alpha_1, i_2, \dots, i_d) \\ &\vdots \\ F^d(\alpha_1, \alpha_2, \dots, \alpha_d) &= \sum_{i_d=1}^q \omega_{i_d}^{(0)} B_{\alpha_d}^{n-\alpha_1-\dots-\alpha_{d-1}}(\xi_{i_d}^{(0)}) F^{d-1}(\alpha_1, \alpha_2, \dots, \end{aligned}$$

Result of recursion

$$\mu_{\alpha}^n(f) = d! |T| F^d(\alpha_1, \alpha_2, \dots, \alpha_d)$$

BROWN

Evaluation of Moments

Claim: The number of operations needed to compute $\mu_{\alpha}^n(f)$ is $\mathcal{O}(n^{d+1})$, even including the cost of evaluating basis functions on the fly.

- ▶ Can obtain element load vector at a cost of $\mathcal{O}(n^{d+1})$ operations, even with variable data f .
- ▶ Hence, curvilinear elements also handled in same complexity.

Ref: Ainsworth, Andriamaro & Davydov, SISC 2011

BROWN

Evaluation of Element Mass Matrix

$$\mathbf{M}_{\alpha\beta}^T = \int_T c(\mathbf{x}) B_{\alpha}^n(\mathbf{x}) B_{\beta}^n(\mathbf{x}) d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Dimension $\binom{n+d}{d} \times \binom{n+d}{d}$ i.e. $\mathcal{O}(n^{2d})$

Is it possible to compute matrix in $\mathcal{O}(1)$
operation per entry? i.e. complexity $\mathcal{O}(n^{2d})$

BROWN

Evaluation of Element Mass Matrix

$$\mathbf{M}_{\alpha\beta}^T = \int_T c(\mathbf{x}) B_{\alpha}^n(\mathbf{x}) B_{\beta}^n(\mathbf{x}) d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Dimension $\binom{n+d}{d} \times \binom{n+d}{d}$ i.e. $\mathcal{O}(n^{2d})$

Is it possible to compute matrix in $\mathcal{O}(1)$
operation per entry? i.e. complexity $\mathcal{O}(n^{2d})$

Karniadakis & Sherwin approach gives $\mathcal{O}(n^{2d+1})$

BROWN

Evaluation of Element Mass Matrix

$$\mathbf{M}_{\alpha\beta}^T = \int_T c(\mathbf{x}) B_{\alpha}^n(\mathbf{x}) B_{\beta}^n(\mathbf{x}) d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Dimension $\binom{n+d}{d} \times \binom{n+d}{d}$ i.e. $\mathcal{O}(n^{2d})$

Is it possible to compute matrix in $\mathcal{O}(1)$
operation per entry? i.e. complexity $\mathcal{O}(n^{2d})$

Karniadakis & Sherwin approach gives $\mathcal{O}(n^{2d+1})$

Eibner & Melenk (2006) gives $\mathcal{O}(n^{2d})$

BUT requires 6-fold increase in dimension.

Evaluation of Element Mass Matrix

Claim: Bernstein-Bezier basis achieves optimal complexity (without tinkering with the space).

$$\mathbf{M}_{\alpha\beta}^T = \int_T c(\mathbf{x}) B_{\alpha}^n(\mathbf{x}) B_{\beta}^n(\mathbf{x}) d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Recall property of Bernstein polynomials

$$B_{\alpha}^n B_{\beta}^n = \frac{\binom{\alpha+\beta}{\alpha}}{\binom{2n}{n}} B_{\alpha+\beta}^{2n}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Evaluation of Element Mass Matrix

Claim: Bernstein-Bezier basis achieves optimal complexity (without tinkering with the space).

$$\mathbf{M}_{\alpha\beta}^T = \int_T c(\mathbf{x}) B_{\alpha}^n(\mathbf{x}) B_{\beta}^n(\mathbf{x}) d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Hence,

$$\mathbf{M}_{\alpha\beta}^T = \frac{\binom{\alpha+\beta}{\alpha}}{\binom{2n}{n}} \mu_{\alpha+\beta}^{2n}(c), \quad \alpha, \beta \in \mathcal{I}_d^n$$

Evaluation of Element Mass Matrix

Apply AAD Algorithm to compute the moments

$$\mu_{\alpha+\beta}^{2n}(c)$$

Complexity: $O((2n)^{d+1})$

BROWN

Evaluation of Element Mass Matrix

Apply AAD Algorithm to compute the moments

$$\mu_{\alpha+\beta}^{2n}(c)$$

Complexity: $\mathcal{O}((2n)^{d+1})$

$$\mathbf{M}_{\alpha\beta}^T = \frac{\binom{\alpha+\beta}{\alpha}}{\binom{2n}{n}} \mu_{\alpha+\beta}^{2n}(c), \quad \alpha, \beta \in \mathcal{I}_d^n$$

Remarkably, multinomials dominate the cost!
... careful treatment gives $\mathcal{O}(n^{2d})$ complexity.

BROWN

Evaluation of Element Stiffness Matrix

$$\mathbf{S}_{\alpha\beta}^T = \int_T \text{grad } B_{\beta}^n(\mathbf{x}) \cdot \mathbf{A}(\mathbf{x}) \cdot \text{grad } B_{\alpha}^n(\mathbf{x}) \, d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Evaluation of Element Stiffness Matrix

$$\mathbf{S}_{\alpha\beta}^T = \int_T \text{grad } B_{\beta}^n(\mathbf{x}) \cdot \mathbf{A}(\mathbf{x}) \cdot \text{grad } B_{\alpha}^n(\mathbf{x}) \, d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Another useful property of Bernstein polys

$$\text{grad } B_{\alpha}^n(\mathbf{x}) = n \sum_{k=1}^{d+1} B_{\alpha - \mathbf{e}_k}^{n-1}(\mathbf{x}) \text{grad } \lambda_k, \quad \alpha \in \mathcal{I}_d^n$$

Evaluation of Element Stiffness Matrix

$$\mathbf{S}_{\alpha\beta}^T = \int_T \text{grad } B_{\beta}^n(\mathbf{x}) \cdot \mathbf{A}(\mathbf{x}) \cdot \text{grad } B_{\alpha}^n(\mathbf{x}) \, d\mathbf{x}, \quad \alpha, \beta \in \mathcal{I}_d^n$$

Another useful property of Bernstein polys

$$\text{grad } B_{\alpha}^n(\mathbf{x}) = n \sum_{k=1}^{d+1} B_{\alpha - \mathbf{e}_k}^{n-1}(\mathbf{x}) \text{grad } \lambda_k, \quad \alpha \in \mathcal{I}_d^n$$

Hence

$$\mathbf{S}_{\alpha\beta}^T = n^2 \sum_{k,l=1}^{d+1} \frac{\binom{\alpha - \mathbf{e}_k + \beta - \mathbf{e}_l}{\alpha - \mathbf{e}_k}}{\binom{2n-2}{n-1}} \text{grad } \lambda_k \cdot \mu_{\alpha - \mathbf{e}_k + \beta - \mathbf{e}_l}^{2n-2}(\mathbf{A}) \cdot \text{grad } \lambda_l$$

BROWN

Bernstein-Bezier \Rightarrow

Optimal Complexity

Theorem: All element matrices can be assembled in optimal complexity $\mathcal{O}(n^{2d})$ including cases where

- ▶ non-constant coefficients
- ▶ non-affine elements
- ▶ coefficients depending on solution u (and/or its derivatives).

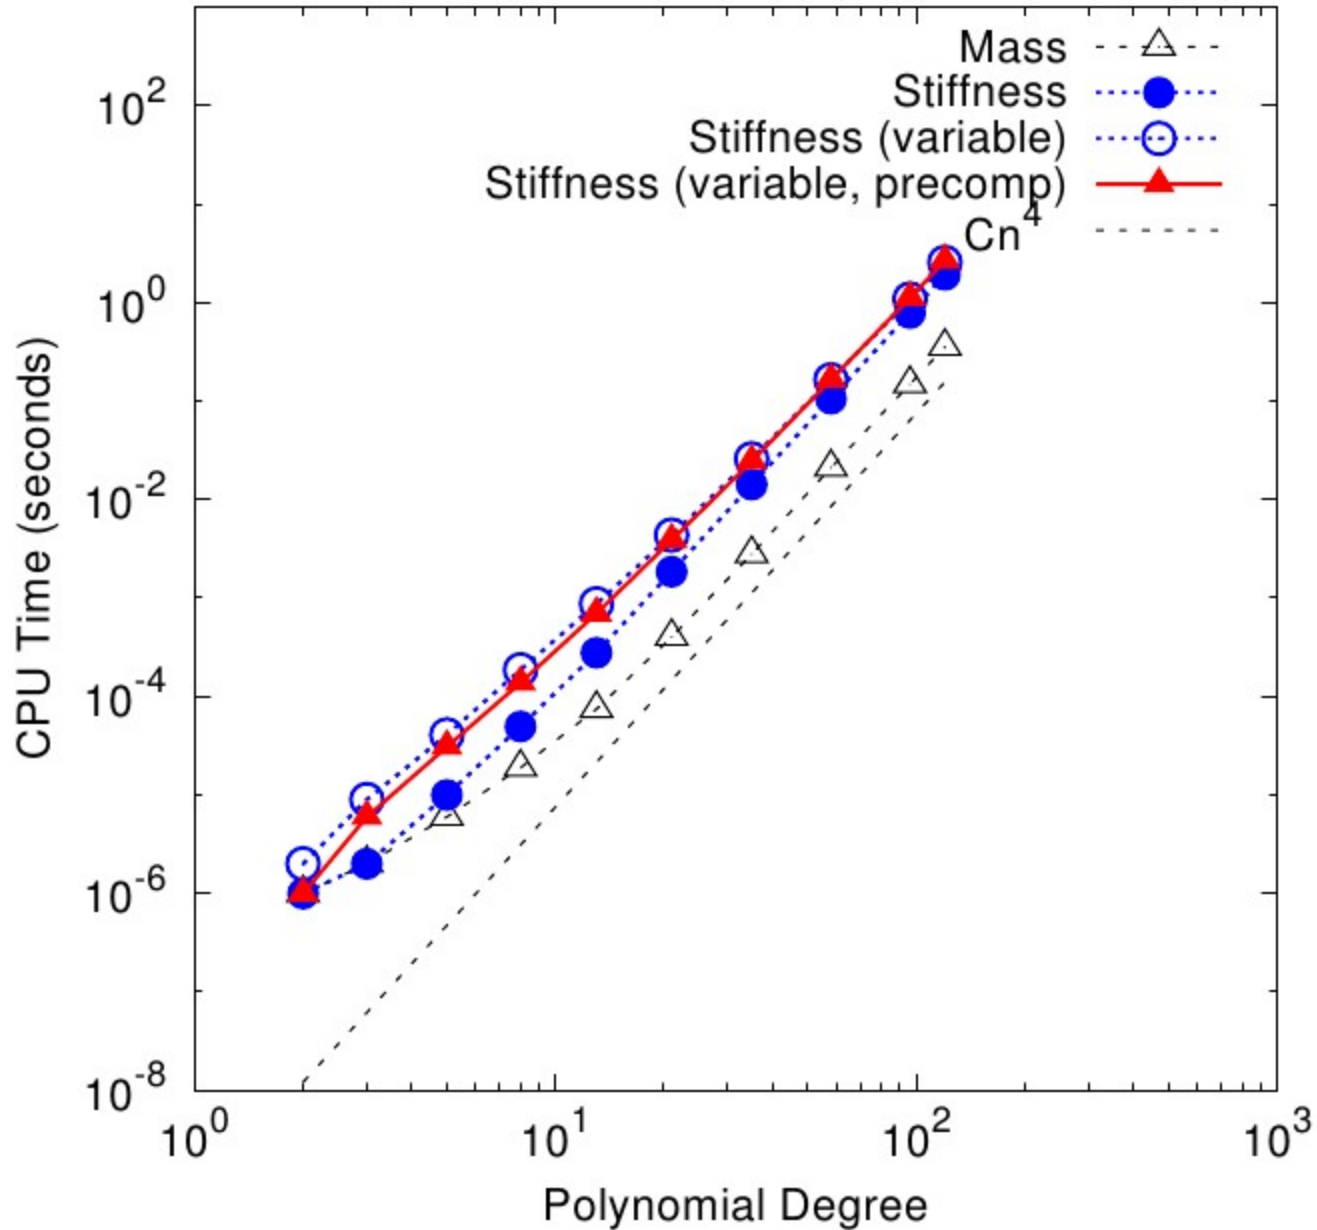

Moreover, complexity achieved even if basis functions evaluated on the fly.

Bernstein-Bezier Basis for Raviart-Thomas Elements

BROWN

Raviart-Thomas Elements

Raviart-Thomas finite element \mathbb{RT}_n of order $n \in \mathbb{Z}_+$

$$\mathbb{RT}_n = \mathbb{P}_n^2 + \mathbf{x}\mathbb{P}_n$$

dimension $(n + 1)(n + 3)$.

e.g. $V_\omega = \text{span}\{\omega_k : k = 1, 2, 3\}$ coincides with \mathbb{RT}_0 .

$$\omega_k = \frac{1}{2|T|}(\mathbf{x} - \mathbf{x}_k), \quad k = 1, 2, 3.$$

Raviart-Thomas ($n=0$)

FIGURE 1. Basis functions for \mathbb{RT}_0 with Whitney functions indicated by arrows.

Equivalent Expression for Basis

Standard RT0 Basis

$$\omega_k = \frac{1}{2|T|} (\mathbf{x} - \mathbf{x}_k)$$

Identical

Whitney functions

$$\omega_1 = \lambda_2 \mathbf{curl} \lambda_3 - \lambda_3 \mathbf{curl} \lambda_2$$

$$= \begin{vmatrix} 1 & 0 & 0 \\ \lambda_1 & \lambda_2 & \lambda_3 \\ \mathbf{curl} \lambda_1 & \mathbf{curl} \lambda_2 & \mathbf{curl} \lambda_3 \end{vmatrix}$$

BROWN

'Generalised' Whitney Functions

By analogy with

$$\omega_1 = \begin{vmatrix} 1 & 0 & 0 \\ \lambda_1 & \lambda_2 & \lambda_3 \\ \text{curl } \lambda_1 & \text{curl } \lambda_2 & \text{curl } \lambda_3 \end{vmatrix}$$

For $\alpha \in \mathcal{I}_n$ define

$$\Upsilon_{\alpha}^n = (n+1)B_{\alpha}^n \begin{vmatrix} \alpha_1 & \alpha_2 & \alpha_3 \\ \lambda_1 & \lambda_2 & \lambda_3 \\ \text{curl } \lambda_1 & \text{curl } \lambda_2 & \text{curl } \lambda_3 \end{vmatrix}$$

Bernstein-Bezier Basis for \mathbb{RT}_n

Dispense with all *three* vertex functions:

$$V_{\text{curl}}^n = \text{span} \left\{ \text{curl } B_{\alpha}^{n+1} : \alpha \in \check{\mathcal{I}}_{n+1} \right\}$$

where

$$\check{\mathcal{I}}_n = \mathcal{I}_n - \{(n, 0, 0), (0, n, 0), (0, 0, n)\}$$

BROWN

*That leaves us *two* short ...*

Bernstein-Bezier Basis for \mathbb{RT}_n

Dispense with *one* 'generalised' Whitney function:

$$V_{\Upsilon}^n = \text{span}\{\Upsilon_{\alpha}^n : \alpha \in \mathcal{I}'_n\}$$

where

$\mathcal{I}'_n = \mathcal{I}_n$ minus any one index

BROWN

We're *three* short now ...

Bernstein-Bezier Basis for \mathbb{RT}_n

Include all *three* lowest order Whitney functions.

Theorem 3.6. *The set*

$$\{\Upsilon_{\alpha}^n : \alpha \in \mathcal{I}'_n\} \cup \left\{ \text{curl } B_{\alpha}^{n+1} : \alpha \in \check{\mathcal{I}}_{n+1} \right\} \cup \{\omega_1, \omega_2, \omega_3\}$$

forms a basis for \mathbb{RT}_n .

What does it mean geometrically?

BROWN

Raviart-Thomas (General Case)

Order n	Internal Dofs		Edge Dofs		Total
	V_{Υ}^n	V_{curl}^n	V_{ω}	V_{curl}^n	
0	-	-	3	-	3
1	2	-	3	3	8
2	5	1	3	6	15
3	9	3	3	9	24
\vdots	\vdots	\vdots	\vdots	\vdots	\vdots
n	$n(n+3)/2$	$n(n-1)/2$	3	$3n$	$(n+1)(n+3)$

BROWN

Application: Darcy Flow

$(\mathbf{u}, p) \in \mathbf{H}(\operatorname{div}; \Omega) \times L_0^2(\Omega)$ such that

$$\mathbf{n} \cdot \mathbf{u} = \psi \text{ on } \partial\Omega \text{ and}$$

$$\frac{\nu}{\kappa} (\mathbf{u}, \mathbf{v}) - (p, \operatorname{div} \mathbf{v}) = -\varrho(\mathbf{g}, \mathbf{v})$$

$$(\operatorname{div} \mathbf{u}, w) = (f, w)$$

for all $(\mathbf{v}, w) \in \mathbf{H}_0(\operatorname{div}; \Omega) \times L_0^2(\Omega)$

Darcy: Element Residuals

Current Approximation:

$$(\mathbf{u}^\ell, p^\ell)$$

Residuals:

$$\mathbf{v} \mapsto -\varrho(\mathbf{g}, \mathbf{v})_T - \frac{\nu}{\kappa} (\mathbf{u}^\ell, \mathbf{v})_T + (p^\ell, \operatorname{div} \mathbf{v})_T$$

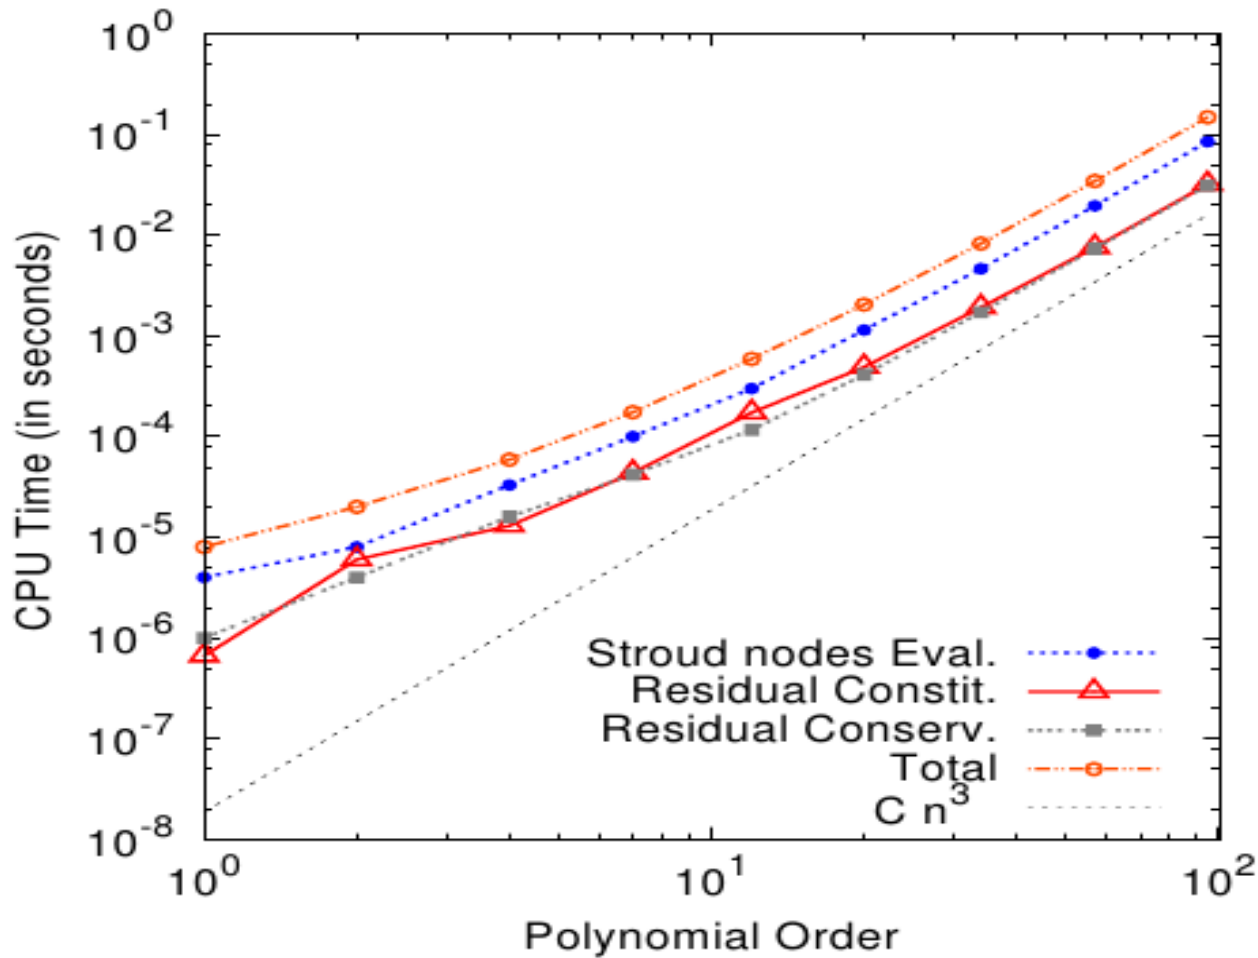

$$w \mapsto (f, w)_T - (\operatorname{div} \mathbf{u}^\ell, w)_T$$

\mathbf{v} is chosen to be Υ_α^n , $\operatorname{curl} B_\alpha^{n+1}$ and ω_k , and $w = B_\alpha^n$.

BROWN

CPU for Element Residuals

BROWN

Application: Maxwell's Equations

find $\mathbf{u} \in H_0(\text{curl})$ and $\lambda \in \mathbb{R}$ such that

$$(\text{curl } \mathbf{u}, \text{curl } \mathbf{v}) = \lambda^2 (\mathbf{u}, \mathbf{v}), \quad \mathbf{v} \in H_0(\text{curl}).$$

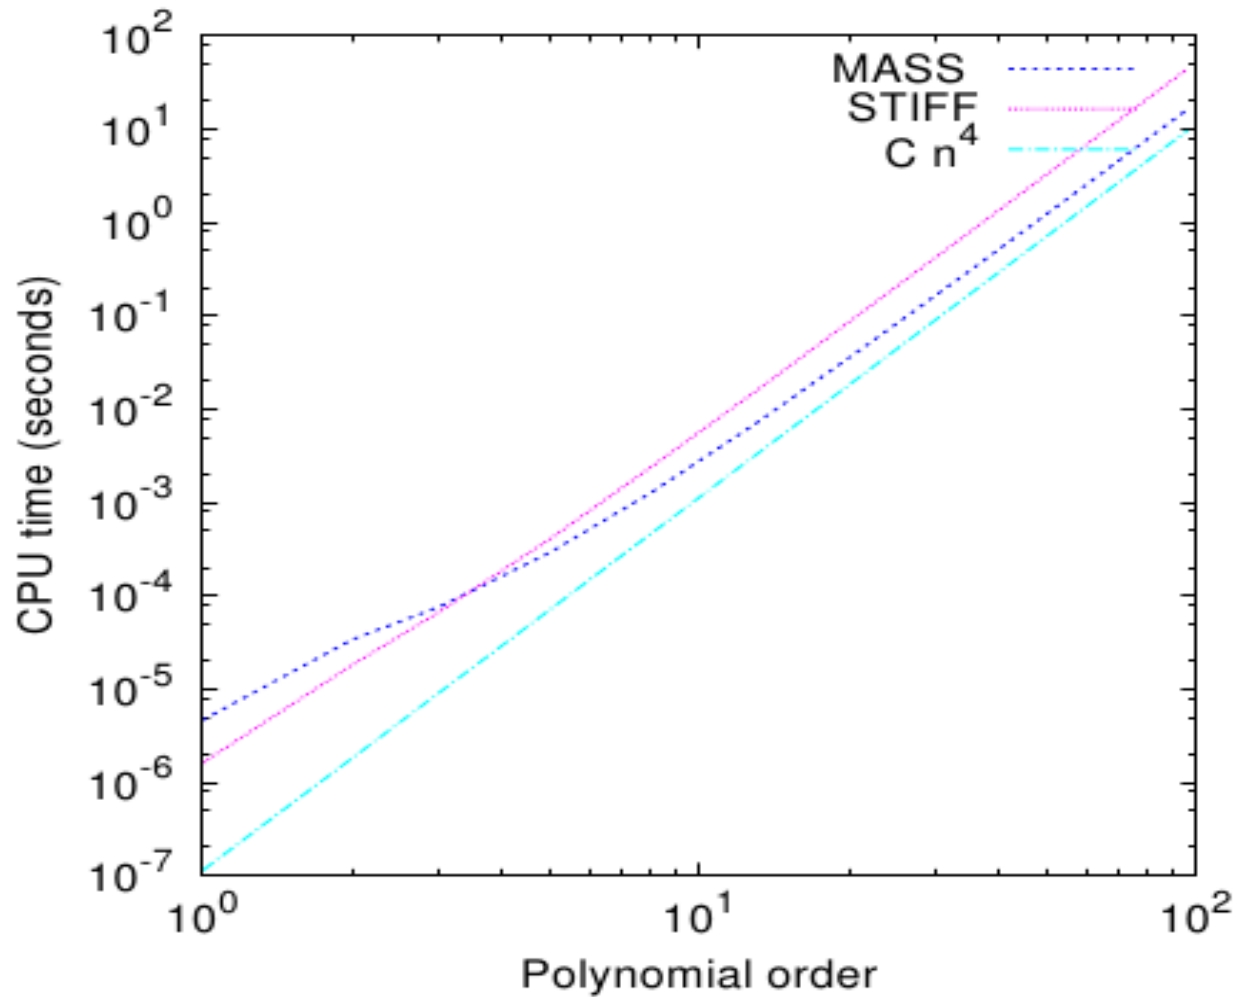

$$\Omega = [0, 1]^2$$

True Solution: $\lambda_{k,\ell}^2 := \pi^2(k^2 + \ell^2), \quad k, \ell \in \mathbb{Z}_+.$

$$\mathbf{u}_{k,\ell}(x, y) := \begin{pmatrix} k \sin(k\pi x) \cos(\ell\pi y) \\ \ell \sin(\ell\pi y) \cos(k\pi x) \end{pmatrix}^\perp$$

Application: Maxwell's Equations
