

Cirrus are ice clouds, very high up. They can look wispy, like hair and never give rain.

Cumulonimbus are thunderclouds. They are very tall, and can give heavy rain, hail, thunder, lightning and even tornadoes

Cumulus clouds can look like cotton wool. They have flatter bottoms and bubbly tops and usually mean the weather is good.

Stratus are sheets or layers of clouds. You might not be able to see their edges.
Grey, flat and boring!
