

How EV/EBITDA Misses The Point On Valuation

Over the past few months we've covered how two of the three most popular valuation metrics—[price to earnings](#) and [price to book](#)—do a poor job of valuing stocks. Now we come to a metric that gets less attention but actually comes in as the second most widely used by equity analysts: enterprise value (EV) to earnings before interest, taxes, depreciation, and amortization (EBITDA).

Nearly [80% of all equity analysts](#) use EV/EBITDA. Many investors and analysts hold it up as the [best metric](#) for measuring valuation. They claim it represents the real cash flows of the business.

In reality, EV/EBITDA can actually be significantly worse than P/E or P/B ratios because EBITDA ignores certain real costs of doing business like taxes, depreciation, and amortization. Put simply, EBITDA is even farther removed from the real cash flows of the business than EPS or net income.

Figure 1 shows how EBITDA gives the misleading impression that gas station operators CST Brands (CST) is increasing profits when its true profitability as measured by return on invested capital ([ROIC](#)) is in sharp decline.

Figure 1: EBITDA Increases But Real Profitability Declines

Sources: YCharts, New Constructs, LLC and company filings.

We'll dig deeper into the structural flaws that make EBITDA so misleading for companies like CST, but first let's take a look at some of the more basic issues that make EBITDA an unreliable metric.

Accounting Numbers Mislead Investors

The root problem for EV/EBITDA is that, while it makes some minor adjustments, it still relies on the same flawed accounting constructs as the other popular metrics. The way enterprise value is commonly calculated excludes several important liabilities that reduce the total cash flow available to shareholders. Excluding these liabilities creates a misleading picture of a company's valuation.

AT&T (T), for instance, has a [reported EV/EBITDA of 7.46](#) based on a calculated enterprise value of \$348 billion. In our system, we show T with an [enterprise value](#) of \$473 billion and an EV/EBITDA that is 10.59, significantly higher than the reported value. What explains this \$125 billion difference?

- \$55 billion in [deferred tax liabilities](#)
- \$37 billion in [underfunded pensions](#)
- \$23 billion in [off-balance sheet debt](#)
- \$1 billion in [deferred compensation costs](#)

All these liabilities represent real claims on cash flows (beyond debt and equity) and should be included in the company's enterprise value.

Removing Taxes Makes No Sense

Intuitively, removing taxes from the equation for EBITDA has a certain amount of logic. Taxes are (mostly) out of a company's control and can theoretically change significantly in any given year due to political developments.

In reality, most companies have fairly stable cash tax rates, and there are often structural differences between companies in terms of geography, type of business, and the amount of tax-deductible expenses such as R&D. These different tax rates play a large role in the amount of future cash flows available to investors.

As an example, let's compare Johnson & Johnson (JNJ) and Colgate Palmolive (CL). Last year, JNJ had a [cash tax rate](#) of 21%, versus 38% for CL. This difference makes sense, as JNJ earns a number of tax breaks from its various healthcare lines and the billions of dollars it devotes to R&D annually, while CL's business does not earn those same types of breaks.

Since 2007, JNJ's cash tax rate has been in a steady band between 20% and 23%. CL's most recent tax rate is slightly higher than normal, but it's been above 30% for every year in our model going back to 1998. Clearly there is a persistent and predictable difference between the amount of taxes these two companies have to pay every year. Excluding those taxes leads to misleading comparisons.

Removing Depreciation and Amortization Ignores the Balance Sheet

Empirical research shows that return on invested capital ([ROIC](#)) is the [most important driver of long-term shareholder value](#). Investors should evaluate companies on the basis of maximizing ROIC.

Through that lens, EBITDA is a worse metric than GAAP earnings. Removing depreciation and amortization ignores the real cost of capital needed to maintain the business. Ignoring the balance sheet of a business is like excluding the at bats that ended in strikeouts when calculating batting average. The more strikeouts, the more misleading that batting average would be.

The same idea applies to EV/EBITDA and [roll-up schemes](#) or companies that grow rapidly through acquisitions. It's easy to grow EBITDA rapidly when you constantly buy up smaller competitors. By ignoring the balance sheet, EBITDA misses the cost of all that growth. If a company keeps deploying capital at a high rate to buy a small increase in EBITDA, real cash flows will decline.

Big banks have an incentive to keep these roll-up schemes going. They make good profits on both advising on the acquisition (M&A fees) and underwriting of the debt and equity needed to fund the acquisitions.

Gas station operator CST Brands (CST) fits the profile of a roll-up. Since the company was spun out from Valero Energy (VLO) in 2013, it has more than doubled its [invested capital](#), from \$1.5 billion to \$3.6 billion. Most of this increase has come from acquisitions, which have failed to deliver any real value. In fact, CST's after-tax profit ([NOPAT](#)) has actually decreased over that timeframe, and its ROIC has dropped from 15% to 5%.

By stripping out the \$209 million in depreciation and amortization expense that CST incurred last year, however, EBITDA actually shows an increase in profitability, from \$429 million in 2012 to \$494 million last year. The stock looks cheap with an [EV/EBITDA of just 8.5](#)

Looking at [free cash flow](#) shows just how misleading that EBITDA number really is. The company has had to significantly boost capex to maintain the business. Along with the acquisition spending, this increased capex has led CST to have nearly \$1.7 billion in negative free cash flows over the past three years.

The stock may seem cheap based on EV/EBITDA, but our [dynamic DCF model](#) reveals the high expectations embedded in the stock price. In order to justify its valuation of ~\$32/share, CST needs to [grow NOPAT by 6% compounded annually for the next 12 years](#).

By pursuing this acquisition strategy, CST's executives have given the illusion of profitability while actually decreasing cash flow. Don't just blame the executives though. They're incentivized to pursue this strategy by a compensation plan that rewards them for maximizing EBITDA.

Cases such as CST show how the popularity of EV/EBITDA isn't just bad for investors, it's bad for the economy as a whole. Firms should be aiming to maximize ROIC, and focusing on EBITDA often encourages managers to pursue low-return strategies simply because it boosts their bonuses.

New Constructs® – Profile

How New Constructs Creates Value for Clients

We find it. You benefit. Cutting-edge technology enables us to scale our [forensic accounting expertise](#) across 3000+ stocks. We shine a light in the dark corners of SEC filings so our clients can make safer, more informed decisions.

Our [stock rating methodology](#) instantly informs you of the quality of the business and the fairness of the stock's valuation. We do the diligence on earnings quality and valuation so you don't have to.

In-depth risk/reward analysis underpins our ratings. Our rating methodology grades every stock, ETF, and mutual fund according to what we believe are the 5 most important criteria for assessing the quality of an equity. Each grade reflects the balance of potential risk and reward of buying that equity. Our analysis results in the 5 ratings described below. Very Attractive and Attractive correspond to a "Buy" rating, Very Dangerous and Dangerous correspond to a "Sell" rating, while Neutral corresponds to a "Hold" rating.

QUESTION: Why shouldn't fund research be as good as stock research? Why should fund investors rely on backward-looking price trends?

ANSWER: They should not.

Don't judge a fund by its cover. Take a look inside at its holdings and understand the quality of earnings and valuation of the stocks it holds. We enable you to choose the best fund based on its stock-picking merits so you do not have to rely solely on backward-looking technical metrics.

The drivers of our [forward-looking fund ratings](#) are Portfolio Management (i.e. the aggregated ratings of its holdings) and Total Annual Costs. The Total Annual Costs Rating ([details here](#)) captures the all-in cost of being in a fund over a 3-year holding period, the average period for all fund investors.

Our Philosophy About Research

Accounting data is not designed for equity investors, but for debt investors. [Accounting data must be translated into economic earnings](#) to understand the profitability and valuation relevant to equity investors. Respected investors (e.g. Adam Smith, Warren Buffett and Ben Graham) have repeatedly emphasized that accounting results should not be used to value stocks. [Economic earnings](#) are what matter because they are:

1. Based on the complete set of financial information available.
2. Standard for all companies.
3. A more accurate representation of the true underlying cash flows of the business.

Additional Information

Incorporated in July 2002, [New Constructs](#) is an independent publisher of investment research that provides clients with consulting and research services. We specialize in quality-of-earnings, forensic accounting and discounted cash flow valuation analyses for all U.S. public companies. We translate accounting data from 10Ks into economic financial statements, i.e. [NOPAT](#), [Invested Capital](#), and [WACC](#), to create [economic earnings models](#), which are necessary to understand the true profitability and valuation of companies. Visit the [Free Archive](#) to download samples of our research. New Constructs is a [BBB accredited](#) business and a member of the [Investorside Research Association](#).

DISCLOSURES

New Constructs®, LLC (together with any subsidiaries and/or affiliates, "New Constructs") is an independent organization with no management ties to the companies it covers. None of the members of New Constructs' management team or the management team of any New Constructs' affiliate holds a seat on the Board of Directors of any of the companies New Constructs covers. New Constructs does not perform any investment or merchant banking functions and does not operate a trading desk.

New Constructs' Stock Ownership Policy prevents any of its employees or managers from engaging in Insider Trading and restricts any trading whereby an employee may exploit inside information regarding our stock research. In addition, employees and managers of the company are bound by a code of ethics that restricts them from purchasing or selling a security that they know or should have known was under consideration for inclusion in a New Constructs report nor may they purchase or sell a security for the first 15 days after New Constructs issues a report on that security.
