1 Introduction

In Northern Ireland, NISRA - the Northern Ireland Statistics and Research Agency - produce annual estimates of the resident population. The population estimates refer to the number of people in the population at 30 June each year, the statistics are therefore often referred to as the mid-year estimates.

The population statistics refer to the *usually resident* population. The definition of usual residence is based on United Nations guidelines¹. NISRA released the first round of Census 2021 population and household estimates on 22 September 2022. In line with this release, NISRA population statistics have now developed 2021 mid-year population estimates for Northern Ireland and Local Government Districts using these census results.

Final results for the current population estimates can be found on [NISRA Mid-year population estimates webpage](#).

2 Population Estimates for Northern Ireland

At the Northern Ireland level, population estimates are updated each year using the cohort component method.

2.1 Components of Change Method

NISRA's usual methods take account for a full year's population change between 1 July and 30 June, with the previous year's population used as the base. For this publication the Census 2021 population was used as the base population and the method was designed to account for the change between census day (21 March) and 30 June. In order to do this, the census population was "aged on" to the 30 June, with births in the period between 22 March and 30 June added in and deaths in this period removed. Net migration was also accounted for during this period. The following formula is thus applied to update the population:

Census day (21 March) population estimate aged on

- + Births to mothers resident in Northern Ireland;
- Deaths;
- + Net migration

¹ [Recommendations on Statistics of International Migration. UN 1998](#)

The following sections describe how the different data sources are used in this calculation.

2.1.1 Census of population

The 2021 Census of population was the basis for the 2021 mid-year estimates.

2.1.2 Ageing of the population

The 2021 Census population by single year of age was aged to 30 June 2021.

2.1.3 Births

Birth figures by sex are obtained from registrations with the General Register Office. This release includes all births that occurred between 22 March and 30 June 2021. Births to non-resident mothers are not included, as evidence from Great Britain and the Republic of Ireland suggests that there is an imbalance between the number of non-Northern Irish mothers giving birth in Northern Ireland on one side, and Northern Ireland mothers giving birth outside Northern Ireland on the other.

2.1.4 Deaths

The General Register Office provides details of registered deaths by sex and single year of age at mid-year. This release includes deaths that occurred between the 22 March and 30 June 2021. Deaths of non-residents are included, under the assumption that equal number of Northern Ireland residents die abroad as non-residents die in Northern Ireland.

2.1.5 Migration into Northern Ireland

Migration into Northern Ireland or *inflows* is defined as persons who come to live in Northern Ireland from the rest of the United Kingdom or any other country for a period of at least one year. Inflows are estimated from the Medical Card Register, which is a list of patients registered with a family doctor. From this, the number, sex and age at mid-year of people who joined or rejoined the register within the period 22 March to 30 June 2021 was determined (this will include people who previously resided here but left and then returned). It is recognised that the Medical Card Register is deficient in recording young adult males; therefore, the age distribution of young adult males is adjusted to be similar to the young adult female age distribution.

2.1.6 Migration out of Northern Ireland

Migration out of Northern Ireland or *outflows* is defined as persons who leave Northern Ireland to live in the rest of the UK or any other country for a period of at least one year. Outflows are estimated from transferred and deregistered medical cards for flows to Great

Britain and countries outside the UK respectively. These estimates are available by sex and age at mid-year. Previous research has shown that not all outflows are measured fully by the medical card register² and therefore de-registrations are scaled up by an additional 67 per cent (i.e. the assumption is that only 3 out of 5 persons who leave Northern Ireland to go abroad deregister from their family GP). This scaling factor was determined through analysis of historic population change using results from Censuses of population. As with inflows it is recognised that the administrative data is deficient in recording young adult males, therefore the age distribution of young adult males is adjusted to be similar to the young adult female age distribution. Migration flows to Great Britain are constrained to figures agreed by NISRA, the Office for National Statistics and National Records Scotland.

2.1.7 Armed Forces

Unlike the standard full-year method, we are not making an adjustment for Armed Forces for the period between census day and mid-year. The age structure of this population is generally stable and the short period between census day and mid-year means any change is assumed to be small. Further, the annual adjustments we make are based on annual stock estimates, and there is a lack of suitably detailed data available to allow for an effective estimate of changes to the Armed Forces population between census day and mid-year to be made.

3 Population Estimates for Areas within Northern Ireland

3.1 *For this release mid-year population estimates are available at Northern Ireland level and for the 11 Local Government Districts. Components of Change method*

For the Local Government Districts, the components of change method was the same as that used for Northern Ireland as a whole. As before, the Census 2021 population was aged on to 30 June 2021, births were added, deaths were removed, and an adjustment was made for migration. The data sources allow for this at the smaller area level due to them providing geographical indicators to georeference the place of usual residence.

At the Northern Ireland level, changes due to migration only involved movements to and from Northern Ireland. When estimating migration for areas within Northern Ireland, consideration must be taken of an additional component of migration, namely migration between areas within Northern Ireland (i.e. internal migration).

² NISRA has previously issued research papers on population migration, for example, [Northern Ireland Migration Methodology Paper](#), [UK Migration Methodology Paper](#) and [Migration Report \(2009\)](#)

3.1.1 Migration within Northern Ireland

Internal (or within Northern Ireland) migration is defined as people moving their place of usual residence within Northern Ireland. Internal migration does not have an impact on the Northern Ireland level annual population estimates, only the distribution of the population across areas within Northern Ireland.

4 **Data Quality**

Population and Migration Estimates for Northern Ireland are based on data gathered from statistical censuses and surveys, and data extracted from administrative or management systems. A brief outline of the main sources used to develop population estimates is given below. A more comprehensive outline of these sources, including details of the quality management actions undertaken to ensure that the data is suitable for population estimates, is detailed within the [Administrative Data Quality Document](#).

Census

For information on the quality of Census data see the 2021 Census Quality Assurance section of the [NISRA website](#).

Births and Deaths

Information supplied at birth / death registration is generally believed to be correct since wilfully supplying false information may render the informant liable to prosecution for perjury. Birth and death figures by sex (and also by single year of age for deaths) are obtained from registrations with the General Register Office (GRO) and all that occurred between 22 March 2021 and 30 June 2021 were included in the 2021 mid-year population estimates.

Migration

Migration is the most difficult component of population change to measure, as unlike births and deaths, there is no complete system for registering migration. Migration is estimated using transfers observed in medical cards³, detailing the list of patients registered with a family doctor:

- inflows (persons who come to live in Northern Ireland for a period of at least one year) are estimated by counting the number of people who registered or re-registered with a family doctor; and
- outflows (persons who leave Northern Ireland for a period of at least one year) are estimated by counting the number of people who de-registered with a family doctor.

³ In previous reports, medical card data was referred to as “health card” data.

Medical card data are also used to estimate internal migration (people moving their place of usual residence within Northern Ireland from one Local Government District to another) between one year and the next.

When the medical card data are processed to calculate migration estimates, figures for migration to / from Great Britain are agreed between the different UK administrations to provide as much accuracy and comparison between UK administrations as possible for users.

5 Quality Assurance

Changes over time and annual population estimates are compared to several administrative data sources. These include those used in the estimation process, but can also include the active medical cards, the electoral roll, benefit claimants, and the number of domestic properties. Any significant differences found are examined further.

The improvements made are carried forward in population outputs going forward, with continued monitoring of the quality and availability of data sources and methodology. A close collaboration with colleagues in the Office for National Statistics and National Records of Scotland ensures continued improvement and comparability.
