RECOMMENDED CITATION

Pew Research Center, July 2020, "Parenting Children in the Age of Screens"

About Pew Research Center

Pew Research Center is a nonpartisan fact tank that informs the public about the issues, attitudes and trends shaping America and the world. It does not take policy positions. It conducts public opinion polling, demographic research, content analysis and other data-driven social science research. The Center studies U.S. politics and policy; journalism and media; internet, science and technology; religion and public life; Hispanic trends; global attitudes and trends; and U.S. social and demographic trends. All of the Center's reports are available at www.pewresearch.org. Pew Research Center is a subsidiary of The Pew Charitable Trusts, its primary funder.

© Pew Research Center 2020

How we did this

Pew Research Center has long studied the changing nature of parenting and family dynamics as well as the adoption of digital technologies. This report focuses on how children engage with digital technologies, screens and social media, as well as parents' attitudes about these behaviors, their concerns about their child's use of technology, and their own assessment of their parenting and experiences with digital tech. These findings are based on a [survey](#) conducted March 2-15, among 3,640 U.S. parents who have at least one child or children ages 17 and under. This includes those who took part as members of Pew Research Center's [American Trends Panel](#) (ATP), an online survey panel that is recruited through national, random sampling of residential addresses, as well as respondents from the Ipsos KnowledgePanel. The margin of sampling error for the full sample is plus or minus 2.2 percentage points.

Recruiting ATP panelists by phone or mail ensures that nearly all U.S. adults have a chance of selection. This gives us confidence that any sample can represent the whole U.S. adult population (see our [Methods 101 explainer](#) on random sampling). To further ensure that each ATP survey reflects a balanced cross section of the nation, the data is weighted to match the U.S. adult population by gender, race, ethnicity, partisan affiliation, education and other categories.

For more, see the report's [methodology](#) about the project. You can also find the questions asked, and the answers the public provided in [this topline](#).

Parenting Children in the Age of Screens

Two-thirds of parents in the U.S. say parenting is harder today than it was 20 years ago, with many citing technologies – like social media or smartphones – as a reason

Parenting has never been easy. But the widespread adoption of smartphones and the rise of social media has introduced a new wrinkle to the challenges of parenthood. In fact, a majority of parents in the United States (66%) – who include those who have at least one child under the age of 18, but who may also have an adult child or children – say that parenting is harder today than it was 20 years ago, with many in this group citing technology as a reason why, according to a Pew Research Center survey conducted in March.

One of the most [highly discussed](#) – [and debated](#) – topics among parents today is screen time. How much is too much? And what impact will screens have on children’s development? Amid these growing questions, the [World Health Organization](#) issued guidelines last year on the amount of time young children should spend in front of screens.

Parents with young children themselves make clear they are anxious about the effects of screen time. Fully 71% of parents of a child under the age of 12 say they are at least somewhat concerned their child might ever spend too much time in front of screens, including 31% who are very concerned about this.¹ And some parents with a child in this age range already believe their child spends too much time on certain devices, including a smartphone. (It is important to note that this survey was fielded before the [COVID-19 outbreak in the U.S.](#) that closed many schools and led to widespread shutdowns and stay-at-home orders throughout the country.)

¹ Throughout this report there are references to parents who have children of various ages. In cases where parents have more than one child in the age ranges discussed, the parents were randomly assigned to talk about a specific child in the relevant age range.

A majority of parents are concerned that their child might ever spend too much time on screens and have reached out to doctors for advice about this

% of U.S. parents of a child age 11 or younger who say ...

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

While a majority of parents with a young child say they are very (39%) or somewhat confident (45%) in knowing the appropriate amount of screen time for their child, they are also seeking out advice from others. Some 61% of parents of a child age 11 or younger say they have received advice or information about screen time from a doctor or other medical professional and 55% say the same about other parents, while 45% of parents of a child age 5 to 11 have turned to teachers for help.

Parents overall are also apprehensive about the long-term effects of smartphones on children's development: 71% believe the widespread use of smartphones by young children might potentially result in more harm than benefits.

These worries come at a time when it is fairly common for children of all ages to engage – in some way – with digital devices.² For example, 80% of parents say their child age 5 to 11 ever uses or interacts with a tablet computer, while 63% say the same about smartphones. For parents of children under the age of 5 those shares are also notable: 48% and 55%, respectively. At the same time, roughly one-third of parents of a child 11 or younger (36%) say their child ever uses or interacts with a voice-activated assistant, like Apple’s Siri or Amazon Alexa. But there are wide age gaps: parents who have an older child, between the ages of 5 and 11 (46%), are more likely than parents with a child age 3 to 4 (30%) or 2 or younger (14%) to say their child uses or interacts with this type of technology.

Terminology

Several terms used in this report are related to parents, age of children and the technology adoption practices of children. This reference guide explains each term.

Parent is used to refer to an adult who reports being a parent or guardian of at least one child under the age of 18, but who may also have an adult child or children.

Parents of a child age 11 or younger is used to refer to parents who report having a child age 11 or younger. In cases where families have more than one child in this age range, these questions asked the parents focus on one of those children, either their oldest or youngest child in this age range (based on random assignment).

Parents of a child age 4 or younger is used to refer to parents whose randomly assigned child is under the age of 5 (0 to 4).

Parents of a child age 5 to 11 is used to refer to parents whose randomly assigned child is between the ages of 5 and 11.

Young child is used to describe children under the age of 12.

Engagement and interaction with digital technology among children was measured by asking parents about the devices their child “uses or interacts with.”

² Questions about technology adoption in Pew Research Center surveys are typically asked to the respondents directly. This survey, however, does ask parents to indicate whether or not their child engages or interacts with various digital technologies.

YouTube has emerged as a key platform for both younger and older kids. Fully 89% of parents of a child age 5 to 11 say their child watches videos on YouTube, as do 81% of those who have a child age 3 to 4 and 57% of those who have a child age 2 or younger. And while majorities of parents whose child uses YouTube credit the platform for entertaining and educating their children, a majority of these parents are concerned about their child being exposed to inappropriate content on the video sharing site.

But the conversation around screen time is not limited to children. Parents themselves grapple with their own device distractions. When asked if they spend too much, too little or not enough time on their phone, more than half of parents overall (56%) say they spend too much time on their smartphone, while about seven-in-ten (68%) say they are at least sometimes distracted by their phone when spending time with their children.

These findings come from a nationally representative survey of 3,640 U.S. parents who have at least one child under the age of 18, but who may also have adult children, conducted online March 2-15, 2020, using Pew Research Center's [American Trends Panel](#) and the [Ipsos KnowledgePanel](#). The following are among the other major findings.

Majority of parents say their child 11 or younger watches videos on YouTube

% of U.S. parents of a child age 11 or younger who say their child ever watches videos on YouTube

Note: If parent has multiple children, they were asked to focus on one child when answering this question. Those who did not give an answer are not shown.

PEW RESEARCH CENTER

Many parents cite technology as a reason why parenting is harder today than in the past

When asked whether parenting is harder, easier or about the same as it was 20 years ago, larger shares of parents (66%) – which includes those who have at least one child under the age of 18 – say they believe it is harder today for most parents. Meanwhile, just 7% think it is easier, while 26% believe parenting is about the same as it was two decades ago.

Across demographic groups, parents are more likely to say that parenting today is more difficult rather than easier when compared with the past, but there are some modest differences by age. About seven-in-ten parents ages 50 and older (71%) say parenting is harder today, versus 66% of 30- to 49-year-old parents and 60% of those ages 18 to 29.

Parents cite a number of different reasons why they think parenting has grown more difficult over the years. Some of the most common responses tend to stress the impact of digital technology (26%), the rise of social media (21%) and how access to technology exposes children to things at a young age (14%). Other

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

commonly cited reasons for parenting growing more difficult include changing morals and values and the costs associated with raising a child.

Parents are wary of the impact of mobile devices, and relatively few think children under 12 should have their own smartphone

With many children having access to mobile devices, one of the questions posed to parents and experts alike is when it is acceptable for children to have their own smartphone or tablet computer.

The ages of 12 to 14 seem to be a major milestone in parents' eyes for smartphones. This survey finds that a majority of parents (73%) believe it is acceptable for children to have their own phone only after they have reached at least the age of 12. Some 45% say smartphone ownership is acceptable between the ages of 12 and 14, and 28% say it is acceptable between the ages of 15 and 17.

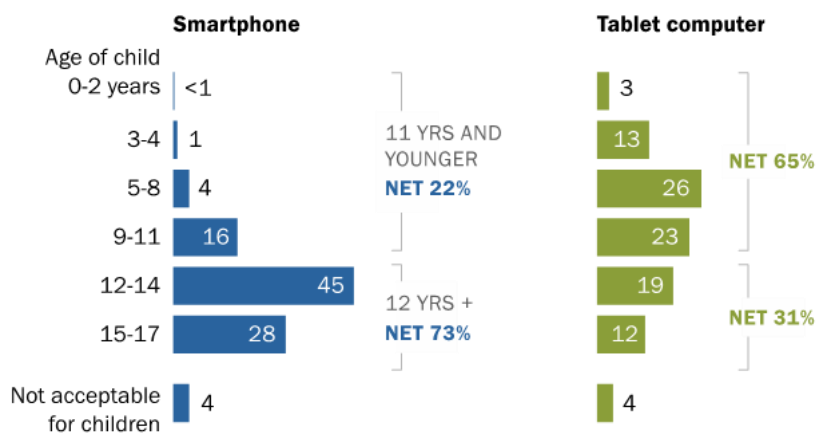

Just 22% think it is OK for a child under the age of 12 to have one.

When asked about the appropriate age for a child to have their own tablet, parents are more accepting of children having one at a younger age. Fully 65% of parents say it is acceptable for child to have their own tablet computer before the age of 12.

Parents who have at least one minor child but who may also have adult children weighed in on whether they thought the use of smartphones by young children would help or hurt their ability to do a variety of things such as develop healthy friendships or do well in school. Parents are concerned about the impact that smartphones could have on children's interpersonal skills. Fully 71% of parents say the use of smartphones by children age 11 or younger will hurt their ability to

PEW RESEARCH CENTER

learn effective social skills a lot or a little, while a similar share says the same about developing healthy friendships. Just over half of parents think these devices will hurt children's ability to do well in school, while parents are more evenly split when it comes to how smartphones will impact children's ability to be creative or pursue their hobbies and interests.

YouTube is widely used by children, with parents seeing both benefits and drawbacks to the platform

Aside from interactions with the devices themselves, children also engage with a range of platforms and websites, and [YouTube has emerged](#) as a key platform for kids.

A clear majority of parents who have a child age 11 or younger say this child ever watches videos on YouTube. Among parents who say their child watches videos this way, 53% say their child does this daily, including 35% who say their child watches these videos on the platform several times a day.

But these numbers vary significantly by race and ethnicity. Black (50%) or Hispanic parents (40%) who have a child in this age range who watches YouTube are more likely to say their child does this several times a day, compared with white parents (29%).

When it comes to their opinions about the video-sharing site, parents offer both positive and negative critiques of the platform. Fully 97% of parents whose child watches videos on YouTube say it keeps their child entertained, 88% believe it helps them learn new things, while 75% say the

PEW RESEARCH CENTER

platform exposes their child to different cultures. Still, majorities of parents are concerned about the types of videos their child may encounter on YouTube, and some report that their child has come across unsuitable material. Some 46% say their child age 11 and younger who watches YouTube videos has encountered videos that were inappropriate for their age.³

Vast majority of parents say they limit when and how long their child can use screens, while digital ‘grounding’ is a relatively common practice for parents

In addition to parents’ concerns about screen time, there are other tech-related worries that are on their minds. Majorities of parents say they are at least somewhat concerned about their child ever being the target of online predators, accessing sexually explicit content, accessing violent content online or ever being bullied or harassed online.

Amid these worries, parents report that they monitor their young child’s digital activities in a number of ways, with most limiting screen time and using digital “grounding” as a disciplinary tactic.

Fully 86% of parents of a child age 5 to 11 say they limit the time of day or length of time their child can use screens, while eight-in-ten say they take away their child’s smartphone or internet privileges as punishment. About three-quarters of parents of a child

“Parenting Children in the Age of Screens”

PEW RESEARCH CENTER

³ YouTube provides a YouTube Kids platform with enhanced parental controls and curated video playlists, but the analysis in this report focuses on YouTube as a whole.

age 5 to 11 say they check the websites this child visits or the mobile apps they use (75%) and use parental controls to restrict how much this child uses screens (72%).

Roughly half of parents of a child in this age range (49%) say they look at the call records or text messages on a smartphone used by this child. Other forms of monitoring like tracking the location of their child through GPS apps or software (33%) or friending or following their child on social media (28%) are far less common.⁴

At the same time, more than half of parents of a child 11 or younger say they are at least somewhat concerned about their child ever being the target of online predators (63%), accessing sexually explicit content (60%) and accessing violent content online (59%). Somewhat similar shares (56%) report they are very or somewhat concerned that their child might ever be bullied or harassed online.

Parents have their own struggles and experiences with smartphones and social media

In addition to monitoring their children's screen time and use of digital devices, parents also acknowledge how their own phones have led to distracted parenting.

More than half (56%) of parents who report having at least one minor child, but who may also have an adult child or children, say they spend too much time on their smartphone, while smaller shares say they spend too much time on social media (36%) or playing video games (11%).

⁴ A Pew Research Center survey conducted in [2014 and 2015](#) on parents of teens found some monitoring practices – like checking websites they visited and their social media profiles – to be common, while others, like using parental controls and monitoring their location with their cellphone, were less prevalent.

A majority of parents also report that their phone can get in the way of spending quality time with their children.

Roughly seven-in-ten parents (68%) say they are at least sometimes distracted by their smartphone, with 17% saying this happens often.

Parents' assessments of their technology use vary by age. For example, parents ages 18 to 49 are more likely than those ages 50 and older to say they spend too much time on their smartphone (59% vs. 36%). Similarly, parents under the age of 50 are more likely than those ages 50 and older to say they often or sometimes feel distracted by their smartphone when spending time with their children (70% vs. 55%).

There are also differences by educational attainment:

Parents with a college degree or higher (59%) or those with some college experience (60%) are more likely than those with a high school education or less (47%) to say they spend too much time on their smartphones. When it comes to feeling distracted by their mobile device, 75% of parents with a college degree say they are least sometimes distracted by their phone when they are spending time with their kids, compared with 68% who have some college experiences and 61% of those who have a high school education or less.

Source: Survey of U.S. adults conducted March 2-15, 2020.

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

In March, Pew Research Center asked parents a series of questions about their children under the age of 12 and how they engage with digital technologies.

The most common device parents say their young child engages with is a television, with 88% of parents saying their child ever uses or interacts with a TV. Smaller – yet still large – shares of parents say their child ever uses or interacts with a tablet computer (67%) or a smartphone (60%). Some 44% of parents of young children say their child ever uses or interacts with a desktop or laptop computer or a gaming device.

There are substantial age differences in the types of devices parents report their child engaging with. For example, 73% of parents with a child age 9 to 11 say their child uses a desktop or laptop computer, compared with 54% of those whose child is age 5 to 8 and just 16% of those with a child younger than 5. The use of gaming devices follows a similar pattern: 68% of parents with a child

age 9 to 11 say their child uses this device, compared with 58% of those with a child age 5 to 8, one-quarter of those whose child is age 3 to 4 and 9% of those with a child age 2 or younger. Similarly, 80% of parents with a child age 5 to 11 say their child uses or interacts with a tablet computer, compared with 64% of parents with a child age 3 to 4 who do this and 35% with a child or a child age 2 or younger.

These differences by the child's age are less pronounced when other devices are considered. For instance, parents with a child age 9 to 11 are more likely to say their child engages with a smartphone (67%), compared with parents with a child age 5 to 8 (59%) or age 2 or younger (49%). Parents with a child age 3 to 4 fall in the middle – 62% say their child uses or interacts with a smartphone.

Parents of the youngest children are less likely to say their child engages with a television, but majorities of all age groups still report doing so – 74% of parents with a child age 2 or younger say their child uses or interacts with a television, compared with 90% or more of parents with a child in somewhat older age groups.

More than one-third of parents with a child under 12 say their child began interacting with a smartphone before the age of 5

Among the 60% of parents who say their child younger than 12 ever uses or interacts with a smartphone, six-in-ten say their child began engaging with a smartphone before the age of 5, including roughly one-third (31%) who say their child began this before age 2 and 29% who say it started between ages 3 and 4. Some 26% of parents whose child uses a smartphone say the smartphone engagement began between the ages 5 and 8. This share falls to

just 14% for parents with a child age 9 to 11.⁵

Nearly one-in-five parents of a child younger than 12 say their child has their own smartphone

Aside from just using and engaging with a smartphone, some children younger than 12 years old have their own device. Nearly one-in-five parents of a child 11 or younger (17%) say that their child has their own smartphone.

There are differences in child smartphone ownership by parents' education level and the age of the child. Parents with a high school education or less are twice as likely as parents who are college graduates to say their child has their own smartphone (21% vs. 11%). Parents with some college education fall in the middle, with 19% saying their child under the age of 12 has their own smartphone.

Parents with somewhat older children are also more likely to say their child has their own device. For example, 37% of parents of a child age 9 to 11 say their child has their own smartphone, compared with 13% of those with a child 5 to 8, 5% of those with a child 3 to 4 and 3% of those with a child who is 2 or younger.

More than a third of parents say their child under the age of 12 uses or interacts with a voice-activated assistant

In addition to details about smartphone engagement and ownership, parents of children under 12 were also asked some questions about their child's engagement with voice-activated assistants.

Roughly one-third of parents of a child age 11 or younger (36%) say their child ever uses or interacts with a voice-activated assistant such as Apple's Siri or Amazon Alexa. There are differences in a child's interaction with this type of device by age of the child, race or ethnicity, parent's level of educational attainment and community type.

Parents who have an older child, between the ages of 5 and 11, are more likely than parents with a child age 3 to 4 or age 2 or younger to say their child uses or interacts with a voice-activated assistant.

Among parents with a child under age 12, those with lower levels of formal education are less likely to say their child engages with a voice-activated assistant – 26% of parents with a high school education or less say their child does this, compared with 38% of parents who have some college education and 42% of college graduates.

White parents are more likely than Hispanic parents to say their child ever interacts with or uses a voice-activated assistant. Those living in suburban locations are also more likely than those living in rural communities to say their child does this.

36% of parents say their child ever interacts with a voice-activated assistant

PEW RESEARCH CENTER

A portion of parents say their child younger than 12 uses social media; use varies by age of child, parents' level of education

Relatively few parents of a child age 11 or younger say that, as far as they know, their child uses social media, though shares are higher for parents of children ages 9 to 11. Despite most social media sites having [age guidelines](#) in place, which usually restrict children younger than 13 from joining, some 13% of these parents say their child uses TikTok and 10% say their child uses Snapchat. Just 5% say their child uses Instagram, and even fewer (3%) say their child uses Facebook. Some 7% of parents say their child uses some other social media site. There are differences in child social media use by age of the child and parents' level of educational attainment.

Parents with a child age 9 to 11 are more likely than parents with a child in younger age groups to say their child uses any of the social media platforms asked about in the survey. For example, three-in-ten parents of a child age 9 to 11 say their child uses TikTok, compared with 11% of parents of a child between the ages of 5 and 8 and 3% of parents of children ages 4 and younger.

Parental education level is also a factor in their child's use of certain social media sites. For example, parents of a child age 11 or younger with a high school education or less are more likely

than those with a postgraduate degree to say their child uses TikTok (19% vs. 6%). This trend also holds for a child's use of Snapchat and Facebook.

Parents are more likely to say their child under age 12 uses a social media site if this child has their own smartphone. For instance, 42% of parents who say their child has their own smartphone also say their child uses TikTok, and 31% say their child uses Snapchat. These shares fall to 10% or less across all platforms for parents who say their child does not have their own smartphone.

Parents of an older child are more likely to say child uses social media sites

% of U.S. parents of a child age 11 or younger who say that, as far as they know, their child uses ...

CORRECTION (Aug. 5, 2020): An earlier version of this report included a chart with a headline that read "Roughly half of parents say their child got their own smartphone between the ages of 9 and 11." This headline has been edited for accuracy to explain that this was only among those whose child had their own smartphone. The chart, now titled "51% of parents whose young child has their own smartphone say this child got the device between the ages of 9 and 11," was also edited so that all figures displayed in the bar chart are scaled correctly.

2. Parental views about YouTube

According to YouTube, [1 billion hours of videos](#) are watched on the site every day, and the platform has over 2 billion users. The video site has also emerged as a key platform in providing content for children. Fully 80% of all parents with a child age 11 or younger say their child ever watches videos on YouTube, with 53% reporting that their child does this daily, including about a third who say this happens several times a day (35%). (For these questions, parents who have more than one child in this age range were randomly assigned to focus on one of their children.)

While parents of an older child are more likely to say their child views content on YouTube, this is a common activity for even

the youngest of children. Roughly nine-in-ten parents of a child age 5 to 11 (89%) report that their child does this, compared with 81% of those with a child age 3 to 4 and 57% of those who have child age 2 or younger. However, the age of the child does not appear to impact the frequency of YouTube viewing. For example, 50% of parents of a child age 4 or younger say their child watches YouTube videos daily, compared with 55% of parents of a child age 5 to 11.

PEW RESEARCH CENTER

Majorities across demographic groups report that their child ever watches videos on YouTube, but *how often* their child does this varies substantially by race and ethnicity. Half of Black parents and 40% of Hispanic parents say their child age 11 or younger who watches YouTube videos does so several times a day, compared with 29% of white parents. In total, majorities of Black parents and Hispanic parents (63% each) say this child watches content on YouTube on a daily basis, compared with 47% of white parents.

Parents who have lower levels of educational attainment are also more likely to say their YouTube-using child is a frequent viewer of the platform's content. Roughly two-thirds of these parents who have a high school education or less (64%) say their child watches videos on the platform daily, compared with 52% of those with some college experience and 45% of those with a bachelor's or advanced degree.

These educational differences are present when looking at parents of the most frequent YouTube-watching children, with parents who have a high school educational or less (46%) being more likely than those with some college experience (34%) or a college degree or more (26%) to say their child watches YouTube content several times a day.

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

These concerns vary by demographics, especially by race and ethnicity and parental education level, but the starkest difference is by the age of the child. Roughly seven-in-ten parents of a YouTube-watching child 5 to 11 years old are very or somewhat concerned about the types of videos being recommended to their child on YouTube, compared with roughly half (51%) of parents of children ages 4 and younger. A similar trend continues across the other potential concerns, with parents of a relatively older child reporting more concern than parents of a child age 4 or younger – by gaps of 17 percentage points or more.

Overall, across races and ethnicities, majorities of parents of a child age 11 or younger who watches videos on YouTube say they are at least somewhat concerned about these things. However, there are significant differences when looking at level of concern. For example, Hispanic parents (50%) are far more likely than white parents (30%) to say they are very concerned about this child encountering inappropriate content on YouTube – a difference of 20 percentage points.

Additionally, those with higher levels of educational attainment are more concerned about their child encountering inappropriate content on the platform and about the types of things being advertised to them. Roughly eight-in-ten parents with a college degree or higher (79%) are very or somewhat concerned about their child encountering inappropriate content on YouTube, while 68% of parents with a high school diploma or less say the same.

When it comes to the effort YouTube is making to keep the platform safe for children, some 46% of parents who have a child under the age of 12 that uses YouTube say the video-sharing site is doing a good or excellent job. A somewhat larger share (53%) believes it to be only a fair or poor job.

Parents’ assessments of how well YouTube is doing in this area varies by their level of education, race and ethnicity, and the frequency with which their child uses the platform.

Among parents who have a child who watches YouTube, those with a high school education or less (54%) or some college experience (49%) are more likely to say YouTube is doing a

good or excellent job at preventing children from seeing inappropriate content than those with a bachelor's degree or more (36%).

Black parents (56%) who have a child that watches content on YouTube are also more likely than white parents (44%) to say YouTube is doing at least a good job at preventing children from seeing content that is inappropriate for their age. Some 46% of Hispanic parents say the same.

There are also differences by the amount of time a parent says their child watches content on YouTube. Parents who say their child watches YouTube at least daily (51%) are more likely to say the platform is doing an excellent or good job of preventing children from seeing inappropriate content than parents who say their child watches YouTube every few weeks (35%) or less often (29%).

3. Parenting approaches and concerns related to digital devices

Digital connectivity offers children new ways to learn and connect, but there are [widespread concerns](#) that the internet and mobile devices give children easy access to inappropriate content and leave youth vulnerable to overuse and even bullying. Parents are especially concerned about the negative impact that smartphones may have on children, including how these devices could hinder their ability to develop interpersonal skills.

Amid these concerns, parents are taking steps to monitor what their children do online or on mobile devices and set ground rules for their digital technology use.

Roughly seven-in-ten parents think smartphones could bring more harm than good to children

Overall, parents who have at least one child under the age of 18 (but who may also have adult children) are more likely to think smartphones have the potential to do more harm than good on young children. Fully 71% of parents say that the potential harm that children under the age of 12 may face from having access to a smartphone outweighs the potential benefits, while 27% believe the potential benefits outweigh the potential harm.

Parents far more likely to see children's access to smartphones as potentially being more harmful than beneficial

Some parents of tech-using children say their young child spends too much time on tech activities

One goal of this survey was to explore parents' views on the amount of time their child spends on several tech-related activities. To assess this, parents were asked to focus on the behavior of one tech-using child under age 12. (Parents with multiple children under 12 were randomly assigned to answer questions about either the youngest child in the family or the oldest child in this age range.) This question was asked only of parents whose children use *particular* technologies, including video games, smartphones and social media.

In this context, about one-quarter of parents whose child plays video games say their child spends too much time doing this (26%). Roughly a quarter whose child uses a smartphone say their child spends too much time doing so (24%), while 20% of parents of a social media-using child say their child spends too much time on this activity.

About a quarter of parents say their young children spend too much time on a smartphone or playing video games

% of U.S. parents of a child age 11 or younger who say their child spends ___ doing the following activities

*Based on those whose child plays video games.

**Based on those whose child uses a smartphone.

***Based on those whose child uses at least one social media site.

PEW RESEARCH CENTER

Vast majority of parents say they limit when, how long their child can use screens; digital ‘grounding’ is relatively common among parents

From screen time limits to digital “grounding,” parents report that they monitor and try to impose limits on their child’s digital activities in a number of ways.⁶

Fully 86% of parents of a child age 5 to 11 say they limit the time of day or length of time their child can use screens, while eight-in-ten say they take away their child’s smartphone or internet privileges as punishment. About three-quarters of parents with a child in this age range say they check the websites this child visits or the mobile apps they use (75%) or use parental controls to restrict how much this child uses screens (72%).

At the same time, roughly half of parents (49%) say they look at the call records or text messages on a smartphone used by this child, while other forms of monitoring like tracking the location of their child through GPS apps or software (33%) or friending or following their child on social media (28%) are far less common.

Roughly eight-in-ten or more parents limit when and how long their child can use screens or digitally ‘ground’ their child

Note: If parent has multiple children, they were asked to focus on one child when answering this question. Those who did not give an answer or who gave other responses are not shown. Source: Survey of U.S. adults conducted March 2-15, 2020. “Parenting Children in the Age of Screens”

PEW RESEARCH CENTER

⁶ A Pew Research [Center survey conducted in 2014 and 2015](#) on parents of teens found some monitoring practices – like checking websites they visited and their social media profiles – to be common, while others, like using parental controls and monitoring their location with their cellphone, were also less prevalent.

There are differences in these monitoring practices by the age of the child and parent's level of educational attainment.

Parents with a child age 9 to 11 are more likely than those who have a 5- to 8-year-old to say they looked at the call records or text messages on a smartphone the child uses (57% vs. 40%) or have used GPS apps or software to track the location of that child (41% vs. 25%).

Additionally, parents with lower levels of formal education are more likely to report that they monitor their child in some of these ways. For example, 40% of parents with a high school education or less say they track the location of their child that is between the ages of 5 to 11 through GPS apps or software, compared with 26% of parents with a college degree or more. This pattern holds when parents are asked about looking at the call records of text messages on a smartphone used by their child, taking away their child's smartphone or internet privileges and friending or following their child on social media.

Parents' digital monitoring varies by educational attainment

% of U.S. parents of a child age 5 to 11, by educational attainment, who say they ...

	Parent's level of education			HS or less- College+ DIFF
	HS or less	Some college	College+	
Track the location of this child through GPS apps or software	40	34	26	+14
Look at the call records or text messages on a smartphone this child uses	54	51	42	+12
Limit the time of day or length of time when this child can use screens	80	89	91	-11
Take away this child's smartphone or internet privileges as punishment	82	86	73	+9
Friend or follow this child on social media sites	33	28	24	+9
Check the websites this child visits or the mobile apps they use	76	79	70	+6
Use parental controls to restrict how much this child uses screens	69	77	71	-2

Note: If parent has multiple children, they were asked to focus on one child when answering this question. Statistically significant differences between those with a high school education or less and those with a college education or higher are highlighted in **bold**. Most parents say it is OK for child to use a mobile device while riding in the car, but smaller shares permit this during meals

When it comes to when a child age 11 or younger should be allowed to use a mobile device like a smartphone or tablet, parents of these children are more accepting of some situations than others. While a vast majority of parents with a child 11 or younger who uses a mobile device say it is OK for their child to use a mobile device while they were a passenger in a car (84%), far fewer parents are OK with their child using such a device just before bedtime (37%), while dining out at a restaurant with family (29%) or while dining with family at home (13%).

Majority of parents OK with child using mobile devices while in a car, but few say they allow this during meals

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

There are differences by race and ethnicity, with Hispanic parents being the least accepting across some cases. For example, 27% of Hispanic parents with a mobile device-using child say they would be OK with their child using a mobile device just before bedtime, compared with 38% of white parents and more than half of Black parents (52%). Hispanic parents (19%) are also less likely to say it is OK for their child to use mobile devices while dining out at a restaurant with family, compared with around three-in-ten of white (33%) or Black parents (31%).

Majority of parents are at least somewhat concerned about their child spending too much time in front of screens

Fully 71% of parents of a child under the age of 12 say they are very or somewhat concerned about their child ever spending too much time in front of screens, including about one-third (31%) who say they are very concerned about this.

Parents of kids ages 5 to 11 and those who are Hispanic or have higher levels of education are more likely to say they are concerned about a range of things their child may encounter online

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

At the same time, roughly six-in-ten parents say they are at least somewhat concerned about their child in this age range ever being the target of online predators (63%), accessing sexually explicit

content (60%) and accessing violent content online (59%). Somewhat similar shares (56%) report they are very or somewhat concerned that their child might ever be bullied or harassed online.

Parents of a child age 5 to 11 express more concern when compared with parents of a child age 4 or younger. For example, 66% of parents of a child age 5 to 11 say they are at least somewhat concerned about their child ever accessing sexually explicit content online, compared with about half of parents (52%) of a child age 4 or younger who say the same. This is also true when parents are asked about their concern about their child spending too much time in front of screens, being the target of online predators, accessing violent online content and being bullied or harassed online.

There are also differences by race and ethnicity. Hispanic parents of a child under the age of 12 are more likely than white or Black parents to say they are concerned that their child might ever be bullied or harassed online, with 64% of Hispanic parents saying this is very or somewhat concerning, compared with 44% of Black parents who say the same. White parents fall in the middle, with 56% saying they are very or somewhat concerned about this. This trend holds when asked about being very or somewhat concerned about their child being the target of online predators as well as accessing sexually explicit or violent content online. On the other hand, 75% of white parents say they are at least somewhat concerned about the amount of screen time their child is getting, compared with 69% of Hispanic parents and 62% of Black parents.

Parents with higher levels of educational attainment who have a child age 11 or younger are also more concerned about most of these scenarios than parents who have lower levels of education. For instance, about eight-in-ten parents (79%) with a college education or higher are concerned about their child spending too much time in front of screens, compared with 69% of parents who have some college education and 64% of parents who have a high school education. This trend follows for parental concerns about accessing sexually explicit and violent content online and their child being bullied or harassed online.

Vast majority of parents of a child under 12 say their child has not been bullied online; most are confident child would tell them if they were

Some 56% of parents of children 11 and younger say they are very or somewhat concerned about their child being bullied or harassed online, yet instances of harassment are not highly reported by parents of young children.

The overwhelming majority of parents of children age 5 to 11 (96%) say that, as far as they know, their child has never been harassed or bullied online. Just 3% say their child has been harassed or bullied online to their knowledge. At the same time, 92% of parents are at least somewhat confident that their child would tell them if they were being cyberbullied, including about six-in-ten (57%) who say they are very confident about this.

Parents' confidence that their child age 5 to 11 would tell them if they were being bullied or harassed online varies by race and ethnicity and educational attainment. Black (66%) and Hispanic (64%) parents are more likely to say they are very confident their child would tell them if this was happening to them online when compared with white parents (55%).

Majorities of parents across educational levels are at least somewhat confident that their child would confide in them about these issues, but parents with some college experience or who have a high college education or less (65% for each) are more likely than those with a bachelor's or advanced degree (44%) to say they are very confident that their child would tell them if they were being bullied online.

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

4. Parents' attitudes – and experiences – related to digital technology

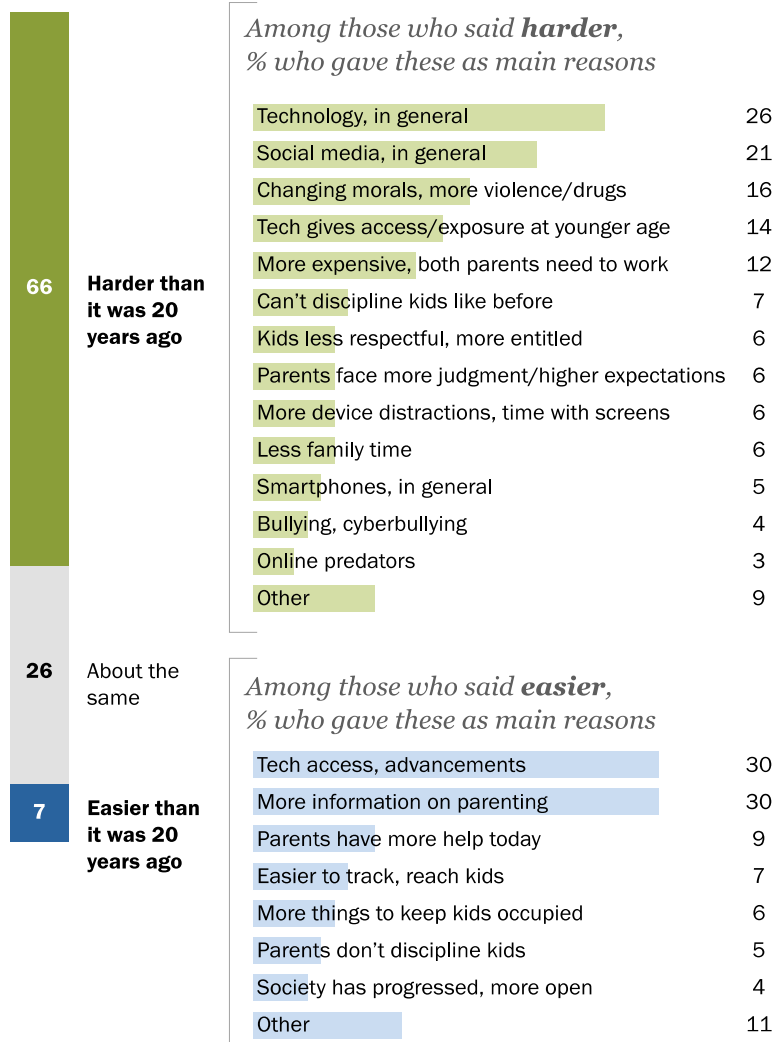

In today's digitally connected world, parents have to manage their own relationship with the internet and mobile devices, along with managing their children's use of and exposure to the same technology. This brings with it a host of both benefits and challenges.

Parents, which includes those who have at least one child under the age of 18 but who may also have adult children, are far more likely to say that parenting is harder today than it was two decades ago than believe the opposite is true. Two-thirds of these parents say that parenting today is harder than it was 20 years ago for most parents. Just 7% say it is easier, and 26% say it is about the same.

The belief that parenting is harder today than in the past is common across demographic groups, but there are some differences by age. Older parents are more likely to say that raising children has grown more difficult, with 71% of parents 50 and older saying

Two-thirds of parents say parenting is harder today than 20 years ago, with technologies like social media and smartphones being cited as a reason

% of U.S. parents who say that for most parents, parenting is ...

Note: Based on parents who have at least one child under the age of 18 but may also have an adult child or children. Those who did not give an answer are not shown. Verbatim responses have been coded into categories and figures may add up to more than 100% because multiple responses were allowed.

PEW RESEARCH CENTER

parenting is harder, compared with smaller shares of parents ages 18 to 49 (65%).

The survey also asked parents to explain, in their own words, why they believe parenting is easier or harder today for most parents than it was 20 years ago.

Among respondents who believe that parenting is harder today, 26% cite technology. Many of these responses mention the increased use of technology and the rapid changes in technology that can be hard for parents to keep up with. They also mention how these technologies may be changing the behaviors and experiences of children. (Responses are lightly edited for spelling, style and readability.)

“Parents don’t know how to handle the technology.” – Man, age 43

“Technology has taught kids instant gratification and no patience.” – Man, age 49

“We have so much technology today that was not available 20 years ago. Social media, reality TV shows, video games have really changed our society and how we interact with each other.” – Woman, age 49

“There’s too much technology. Kids are addicted. They don’t go outside, they don’t hang out with friends, they are getting overweight due to lack of exercise and poor diet.” – Man, age 46

Another 21% of these respondents mentioned social media and the potential negative impact it may be having on children.

“I think that social media is harmful to kids and their self-concepts and self-images. It’s difficult to combat the messages that [they] are getting ALL THE TIME from the outside world. Being a teen is more difficult than it was even 10 years ago, and much more difficult than it was 30 years ago. Parenting through all of the obstacles is really challenging.” – Woman, age 51

“Social media, more information available about everybody. Fear of strangers communicating with kids via internet.” – Man, age 43

Other responses cited the changing morals of society. These responses often noted that society is worse off today than in the past, with more violence and more drugs.

“Kids are doing more drugs and drinking. Less religion in people’s lives.” – Woman, age 48

“Moral slide in culture at large creates a hostile environment for parents who are trying to instill values in their children.” – Man, age 53

“It’s a different world, more violence, more sex trafficking, more crime, more dangers.” – Woman, age 41

Some 14% of parents that view parenting as a harder endeavor today than in the past also note that they believe technology gives kids access and exposure to things at a young age, which in turn makes parenting harder, while some parents mention financial constraints, including the need for both parents to work in order to raise a family.

“So much access to information with electronic devices. Information overload gives kids too many ideas and can adversely affect their behavior.” – Man, age 45

“While the internet can be wonderful, it also makes inappropriate material far too accessible for children and also makes them vulnerable to predators. Parents must stay engaged with technology to monitor use in efforts to protect children more than previous generations.” – Woman, age 37

“Salaries have not kept up with cost of living increases and so most families are struggling to make ends meet and raise a child at the same time. Technology has also added new challenges.” – Man, age 36

“More families 20 years ago had two parents, and often one parent could care for the children full time. Now, many families are single parent or often both parents feel the need to work in order to make ends meet. The work/family time balance can be stressful now.” – Woman, age 31

Less commonly mentioned reasons center around not being able to discipline children in the same way as in the past, children being less respectful and more entitled, higher expectations on parents and more judgment, more device distractions and too much time with screens, and less family time.

In total, roughly half of parents (52%) who believe that parenting is harder today than it was 20 years ago cited technology in some way as a reason.

Parents who say parenting is easier today cite tech advancements, access to more information and advice

By contrast, a relatively small share of parents agree that parenting today is easier than two decades ago. When asked to explain why they thought parenting is easier now than in the past for most parents, the most commonly cited reasons revolve around advancement and access to technology, more information and advice for parents and the ease of keeping track of kids.

Some 30% of parents reference how technology has improved education and entertainment and made parents' lives easier.

“Technology! Kids can play games for entertainment or education. It’s a great distraction when you need them to be home, but you have to cook. Also, kids with learning disabilities thrive with the help of devices.” – Woman, age 35

“People are better off today. Technology has advanced to make parenting, security and transportation easier.” – Man, age 34

“Technology helps and our kids are smarter and learn faster.” – Woman, age 38

Parents who mentioned that parenting is easier today due to more information being available for parents often noted the accessibility of resources on the internet and access to a broad range of sources.

“Many more resources are available for parents now than then. More books, more articles, better psychological services available, better understanding of what makes a good childhood, better everything.” – Man, age 35

“The information available to us to educate ourselves when it comes to a child’s development and what is best for them.” – Woman, age 24

“There [are] way more resources to guide and help new parents nowadays. Most of which are free and some for very low or reasonable prices.” – Man, age 31

“The internet information helps a lot with professional advice on child psychology and medical information.” – Woman, age 52

About one-in-ten parents (9%) who said parenting is easier today than it was 20 years ago say that parents have more help.

“There’s so much more help today, with everything.” – Woman, age 21

“More younger parents have their parents to help or leave their kids with.” – Woman, age 48

“More care options.” – Man, age 44

Another 7% of parents said that today, it is easier to keep track of and reach children.

“Due to today’s technology we can monitor and track our kid’s movements. Both physically and daily in school.” – Woman, age 42

“As a parent you can have better tabs on your child. You know how they are doing in school, you can track where they are and you can put better limits on what they can see and for how long.” – Man, age 42

Some 6% of parents also noted that there are more things to keep children occupied today compared with 20 years ago.

“We have more options to entertain, play and teach.” – Woman, age 32

“More diversions to keep kids entertained, they can also look up information at a moment’s notice that would have required a trip to the library. Internet was dial up then.” – Man, age 57

Fewer respondents mentioned that parents don’t discipline their kids in the same way and the role of parents has shifted (5%) and that society in general has progressed and is more open (4%).

Across all of the open-ended responses about why parenting is easier today than it was 20 years ago, 43% of respondents cited some form of technology.

Fathers are more likely than mothers to say they don't spend enough time with their children

Parents of at least one child under the age of 18, but who may also have adult children, are far more likely to say they spend too little (45%) rather than too much time (5%) with their children, while half believe that they spend about the right amount of time with their kids, but whether parents believe they spend too much or not enough time with their children varies by gender, educational attainment and employment status. (It is worth noting this survey was fielding in March, prior to the [COVID-19 outbreak in the U.S.](#) that closed many schools and led to widespread shutdowns and stay-at-home orders throughout the country.)

About half of fathers overall (53%) say they spend too little time with their children, compared with 38% of mothers who say the same. Those who have a bachelor's degree or higher (53%) are slightly more likely to say they spend the right amount of time with their children than those who have some college education or less (48%).

Parents who were employed full-time at the time of the survey were also more likely to report spending too little time with their children when compared with those who are either employed part-time or not employed.⁷

In March, more than four-in-ten parents say they spent too little time with their children

% of U.S. parents who say they spend ___ with their children

Note: Based on parents who have at least one child under the age of 18 but may also have an adult child or children. Those who did not give an answer are not shown.

⁷ This survey was fielded in early March 2020, before the widespread shutdowns due to COVID-19 that resulted in significant job losses. The [U.S. Bureau of Labor and Statistics](#) estimates that the [unemployment rate](#) in May 2020 might have been as high as 16% and a Pew Research

More than half of parents say they spend too much time on their smartphone

More than half of parents who have at least one child under the age of 18 (but who may also have adult children) say they spend too much time on their smartphone (56%), with smaller shares saying this about the amount of time they spend on social media (36%) or playing video games (11%).

Mothers (61%) are more likely than fathers (49%) to say they spend too much time on their smartphone, while white parents (60%) are also more likely than their Black (52%) and Hispanic (46%) counterparts to say they spend too much time on their phones.

Parents under the age of 50 are more likely than those 50 and older to report spending too much time on their smartphone. For instance, 65% of parents ages 18 to 29 and 58% of parents 30 to 49 say they spend too much time on their smartphone, compared with roughly one-third of parents over 50 (36%) who say the same.

There are also differences by education level. When it comes to saying they spend too much time on their smartphones, about six-in-ten parents who have some college education or higher say this, compared with 47% of parents who have a high school education or less.

Parents' assessments of their social media use follow similar patterns, with parents who are women, white, younger and who have higher levels of educational attainment saying they spend too much time on these sites.

Roughly six-in-ten parents say they spend too much time on their smartphone

‘Sharenting’: Most parents who use social media have posted things about their kids on social media; 76% say being able to easily share information with family and friends is a major reason why they post

The phenomenon of parents posting and sharing photos and other things about their children on social media, sometimes referred to as “sharenting,” has been the subject of [editorials](#) and [thought pieces](#) in recent years. This survey explored several aspects of “sharenting” and finds that 82% of parents who use social media say they have posted photos, videos or other information about their children on these sites.

Among social media-using parents who have at least one minor child (but who may have an adult child or children), women are more likely than men to say they have done this (89% vs. 71%).

Younger social media-using parents – those between the ages of 18 and 49 – are also more likely to report that they have done this than are parents 50 and older who also use these sites.

Roughly eight-in-ten parents who use social media have posted things about their children on these sites

Among U.S. parents who use social media, % who say they have ever shared photos, videos or information about their children on social media sites

Note: Based on parents who have at least one child under the age of 18 but may also have an adult child or children. Those who did not answer are not shown.

PEW RESEARCH CENTER

Fully 76% of parents who are sharers say that the ability to easily share things about their children with friends and family is a major reason for sharing, while smaller portions say showcasing their children’s accomplishments (36%) and sharing because other parents they know share these things (11%) are major reasons why they post things about their children on social media.

Parents’ reasons for posting this type of content vary by gender, race and ethnicity and

educational level. For example, mothers who use social media and who share this information (78%) say that sharing things about their children with family and friends is a major reason for sharing on social media, compared with 72% of fathers who say the same. This trend carries across the other two reasons – showcasing children’s accomplishments and other parents they know sharing this type of information on social media – with mothers more than fathers saying these things are more of a major reason for sharing.

Reasons for sharing also vary by race and ethnicity. Among white parents who have shared things about their children on social media, easily sharing things about their children with friends and family is more of a reason for sharing than it is for Black parents; Hispanic parents are squarely in the middle. When showcasing their children’s accomplishments is considered, Black parents who use social media (50%) are more likely to say this is a major reason, compared with smaller shares of Hispanic (39%) or white parents (33%) who use these platforms.

Ability to easily share things about their children with family and friends is a major reason for ‘sharenting’

Among U.S. parents who have shared things about their children on social media, % who say the following are a ___ for doing so

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

When thinking about other parents sharing photos, videos and information about their own children on social media, about half of social media-using parents (52%) say others share too much about their young children, with a slightly smaller share (44%) saying they share the right amount.

About half of parents say others share too much about their young children on social media

Among U.S. parents who use social media, % who say other parents share ___ about their young children on social media sites

Note: Based on parents who have at least one child under the age of 18 but may also have an adult child or children. Those who did not give an answer are not shown.

Source: Survey of U.S. adults conducted March 2-15, 2020.
"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

The majority of those who use social media say they rarely or never (76%) feel pressure to only post things that make them look like a good parent, with 54% of that share saying they never feel this pressure. About one-quarter of parents (24%) say they sometimes or often feel such pressure.

Among those who use social media, about three-in-ten mothers (28%) say they at least sometimes feel pressure to only post things that make them look like a good parent, compared with 18% of fathers who say the same. Younger parents (those 18 to 49) are also more likely to say they feel this pressure than parents 50 and older. There are also differences by parents' educational level – with 30% of college graduates feeling pressure to only post things on social media that make them look like a good parent, compared with smaller shares of those with some college experience (20%) or a high school education or less (19%).

Those who say they do a fair or poor job as a parent (32%) are also more likely to say they feel this pressure when compared with those who rate themselves as very good or good parents (23%).

24% of social media-using parents say they feel pressure to only post things that make them look good, but this varies by age, gender, education

Among U.S. parents who use social media, % who say they ___ feel pressure to only post things on social media sites that make them look like a good parent to others

Note: Based on parents who have at least one child under the age of 18 but may also have an adult child or children. Those who did not give an answer or who gave other responses are not shown. Source: Survey of U.S. adults conducted March 2-15, 2020. "Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

Some of the arguments against “sharenting” have focused on protecting children online. Other arguments have centered on worries about children’s ability to grant consent. The majority of parents who share photos, videos and information about their children on social media say they rarely or never (83%) worry that in the future their children might be upset about the things they posted about them on social media sites. Just 16% say they worry about this sometimes or often.

Only 16% of parents at least sometimes worry about their children being upset about the things posted about them on social media

Among U.S. parents who have shared things about their children on social media, % who say they ___ worry that in the future their children might be upset about the things they posted about them on social media sites

Note: Based on parents who have at least one child under the age of 18 but may also have an adult child or children. Those who did not give an answer are not shown.

“Parenting Children in the Age of Screens”

PEW RESEARCH CENTER

Roughly 60% of parents of a child under age 12 say they get screen time advice from doctors or other parents

Majorities of parents of a child age 11 or younger say they ever get advice or information about screen time from doctors or other medical professionals (61%) or other parents (55%), with about four-in-ten consulting books or magazines (38%). Roughly half of parents of children ages 5 to 11 (45%) rely on teachers for this type of information and advice. Some parents who are internet and social media users turn to online resources and communities – with 40% of parents who use the internet getting advice from parenting websites or blogs, 29% of parents who use social media turning to social media sites and 19% of internet-using parents getting information from online message boards.

Majority of parents turn to doctors or other parents for advice or information about screen time

"Parenting Children in the Age of Screens"

PEW RESEARCH CENTER

Getting advice and information about screen time varies by parents' gender and level of education.

Mothers are more likely to say they get advice from nearly all of these sources. For instance, 67% of women say they ever get parenting advice or information about screen time from doctors or other medical professionals, compared with 53% of men. Women who use the internet are also more likely than men who use internet to consult parenting websites or blogs for screen time information and advice (46% vs. 32%).

Those with higher levels of education are also more likely to report that they've gotten advice or information about screen time from many of these sources, compared with parents with lower levels of education. For instance, parents with a college education or more (66%) are more likely to have gotten parenting advice about screen time from doctors or other medical professionals, compared with parents who have a high school diploma or less (56%). College-educated parents are also more likely to get information from other parents and books or magazines. College-educated parents of a child in this age range who use the internet are also more likely to get information or advice about screen time from parenting sites and blogs.

Parents with higher levels of education more likely to consult doctors, other parents, parenting websites and blogs for screen time advice

In addition, the project benefited greatly from the guidance of Pew Research Center's methodology team: Courtney Kennedy, Andrew Mercer, Nick Bertoni, Joshua Ferno, Nick Hatley and Arnold Lau, as well as from feedback by the following Pew Research Center staff: Ruth Igielnik, Juliana Horowitz, and Besheer Mohamed. The Center received invaluable advice in developing the questionnaire from Amanda Lenhart, Program Director, Health & Data, Data & Society, Craig Watkins, Professor at the University of Texas at Austin, Priya Kumar, Doctoral Candidate at the University of Maryland, College Park and Kole Binger, Associate Research Specialist at the University of Wisconsin-Madison.

Methodology

The American Trends Panel survey methodology

The American Trends Panel (ATP), created by Pew Research Center, is a nationally representative panel of randomly selected U.S. adults. Panelists participate via self-administered web surveys. Panelists who do not have internet access at home are provided with a tablet and wireless internet connection. The panel is being managed by Ipsos.

Data in this report is drawn from the panel wave conducted March 2 to March 15, 2020. A total of 3,640 panelists responded out of 5,513 who were sampled, for a response rate of 66%. This includes 3,194 from the ATP

and an oversample of 446 respondents sampled from Ipsos' KnowledgePanel who are parents of a child age 11 or under. This does not include one panelist who was removed from the data due to an extremely high refusal rate. The cumulative response rate accounting for nonresponse to the recruitment surveys and attrition is 3.4%. The break-off rate among panelists who logged on to the survey and completed at least one item is 1.9%. The margin of sampling error for the full sample of 3,640 respondents is plus or minus 2.2 percentage points.

American Trends Panel recruitment surveys

Recruitment dates	Mode	Invited	Joined	Active panelists remaining
Jan. 23 to March 16, 2014	Landline/ cell RDD	9,809	5,338	2,315
Aug. 27 to Oct. 4, 2015	Landline/ cell RDD	6,004	2,976	1,337
April 25 to June 4, 2017	Landline/ cell RDD	3,905	1,628	685
Aug. 8 to Oct. 31, 2018	ABS/web	9,396	8,778	6,415
Aug. 19 to Nov. 30, 2019	ABS/web	5,900	4,720	4,692
	Total	35,014	23,440	15,444

Note: Approximately once per year, panelists who have not participated in multiple consecutive waves or who did not complete an annual profiling survey are removed from the panel. Panelists also become inactive if they ask to be removed from the panel.

PEW RESEARCH CENTER

The subsample consisted of active ATP members who said in their profile surveys that they were parents of a child younger than 18, as well as active KnowledgePanel members who said in their profile surveys that they were parents of a child younger than 12.

The ATP was created in 2014, with the first cohort of panelists invited to join the panel at the end of a large, national, landline and cellphone random-digit-dial survey that was conducted in both English and Spanish. Two additional recruitments were conducted using the same method in 2015

and 2017, respectively. Across these three surveys, a total of 19,718 adults were invited to join the ATP, of which 9,942 agreed to participate.

In August 2018, the ATP switched from telephone to address-based recruitment. Invitations were sent to a random, address-based sample (ABS) of households selected from the U.S. Postal Service's Delivery Sequence File. In each household, the adult with the next birthday was asked to go online to complete a survey, at the end of which they were invited to join the panel. For a random half-sample of invitations, households without internet access were instructed to return a postcard. These households were contacted by telephone and sent a tablet if they agreed to participate. A total of 9,396 were invited to join the panel, and 8,778 agreed to join the panel and completed an initial profile survey. The same recruitment procedure was carried out on August 19, 2019, from which a total of 5,900 were invited to join the panel and 4,720 agreed to join the panel and completed an initial profile survey. Of the 23,440 individuals who have ever joined the ATP, 15,444 remained active panelists and continued to receive survey invitations at the time this survey was conducted.

The U.S. Postal Service's Delivery Sequence File has been estimated to cover as much as 98% of the population, although some studies suggest that the coverage could be in the low 90% range.⁸

⁸ AAPOR Task Force on Address-based Sampling. 2016. "[AAPOR Report: Address-based Sampling](#)."

Weighting

The ATP data was weighted in a multistep process that begins with a base weight incorporating the respondents' original selection probability. The next step in the weighting uses an iterative technique that aligns the sample to population benchmarks on the dimensions listed in the accompanying table.

Sampling errors and test of statistical significance take into account the effect of weighting. Interviews are conducted in both English and Spanish.

In addition to sampling error, one should bear in mind that question wording and practical difficulties in conducting surveys can introduce error or bias into the findings of opinion polls.

Weighting dimensions

Variable	Benchmark source
Gender	2018 American Community Survey
Age	
Education	
Race/Hispanic origin	
Country of birth among Hispanics	
Home internet access	
Number and age(s) of children in the household	
Region x Metropolitan status	2019 CPS March Supplement
Volunteerism	2017 CPS Volunteering & Civic Life Supplement
Voter registration	2018 CPS Voting and Registration Supplement
Party affiliation	Average of the three most recent Pew Research Center telephone surveys.

Note: Estimates from the ACS are based on non-institutionalized adults. Voter registration is calculated using procedures from Hur, Achen (2013) and rescaled to include the total U.S. adult population.

PEW RESEARCH CENTER

The following table shows the unweighted sample sizes and the error attributable to sampling that would be expected at the 95% level of confidence for different groups in the survey:

Group	Unweighted sample size	Plus or minus ...	
Total sample of parents	3,640	2.2 percentage points	
Men	1,490	3.6 percentage points	
Women	2,145	2.9 percentage points	
White, non-Hispanic	2,092	2.8 percentage points	
Black, non-Hispanic	322	7.3 percentage points	
Hispanic	945	5.3 percentage points	
Ages 18-29	300	7.4 percentage points	
30-49	2,704	2.6 percentage points	
50+	621	5.4 percentage points	
HS or less	601	5.1 percentage points	
Some college	1,030	3.8 percentage points	
College+	2,002	2.8 percentage points	
Employed full-time	2,456	2.7 percentage points	
Employed part-time	466	6.3 percentage points	
Not employed	702	5.2 percentage points	
Urban	999	4.6 percentage points	
Suburban	1,877	3.1 percentage points	
Rural	757	4.6 percentage points	
Group	Unweighted sample size	Weighted percentage	Plus or minus ...
Rep/Lean Rep	1,556	44	3.4 percentage points
Dem/Lean Dem	1,963	50	3.1 percentage points

Group	Unweighted sample size	Plus or minus ...
Total sample of parents of a child age 11 or younger	2,647	2.6 percentage points
Men	1,063	4.2 percentage points
Women	1,580	3.3 percentage points
White, non-Hispanic	1,498	3.2 percentage points
Black, non-Hispanic	237	8.6 percentage points
Hispanic	691	6.1 percentage points
Ages 18-29	294	7.5 percentage points
30-49	2,140	2.9 percentage points
50+	202	9.8 percentage points
HS or less	450	5.8 percentage points
Some college	717	4.6 percentage points
College+	1,476	3.2 percentage points
Urban	732	5.4 percentage points
Suburban	1,351	3.6 percentage points
Rural	559	5.3 percentage points

Sample sizes and sampling errors for other subgroups are available upon request.
